CASS COUNTY

INCLUDED: [Significant feature(s) of bridge given in boldface]
 [Field inventoried bridge indicated by asterisk]

Inv. No.	MHTD	Bridge Name	Description
*CASS01	H 453R1	Archie Bridge	3-140' steel plate deck girder 1951 Knutson-Gould Constr. Co.
*CASS02	L 23R	CRI&P Railroad Overpass	1-260' riveted Parker through truss 1948 Perry McGlone Constr. Co.
CASS03	016000.7	West Fork Bridge	(replaced)
CASS04	058001.1	Bridge	1- 45' c 1910 pinned Pratt bedstead
CASS05	073000.6	Big Creek Bridge	1- 60' c 1905 pinned Pratt bedstead
CASS06	078001.3	Middle Big Creek Bridge	1- 80' c 1910 pinned Pratt pony truss
CASS07	109000.0	Duncan Creek Bridge	1- 65' c 1910 pinned Pratt half-hip pony truss
CASS08	112000.4	Big Creek Bridge	1- 60' c 1910 pinned Pratt pony truss
CASS09	117000.5	Camp Creek Bridge	1- 55' c 1905 pinned Pratt pony truss
CASS10	126001.7	East Creek Bridge	(replaced)
CASS11	139000.1	Strasburg Bridge	(replaced)
CASS12	140000.6	Templeton Bridge	1- 40' 1905 pinned Pratt bedstead George Bird, Harrisonville MO
CASS13	141001.4	East Creek Bridge	(replaced)
CASS14	149001.1	Crawford Creek Bridge	1- 55' c 1890 pinned Pratt pony truss Kansas City B&I Company
CASS15	154001.6	Big Creek Bridge	(replaced)
CASS16	162001.2	Crawford Creek Bridge	1- 45' c 1905 pinned Pratt bedstead S.B. Coutts, Harrisonville MO
CASS17	165000.0	Crawford Creek Bridge	1- 60' 1910 pinned Pratt half-hip pony truss Canton Bridge Co., Canton OH
CASS18	170004.1	Massey Creek Bridge	1- 55' c 1910 pinned Pratt pony truss
CASS19	187000.2	Town Creek Bridge	1- 25' c 1910 pinned Pratt half-hip pony truss
CASS20	191000.2	Massey Creek Bridge	1- 75' 1910 pinned Pratt half-hip pony truss Western Bridge Company
*CASS21	193001.0	Hall Bridge	(replaced)
*CASS22	194000.4	Massey Creek Bridge	1- 85' c 1890 pinned Pratt through truss
CASS23	213000.6	Lusher Bridge	1- 40' 1911 pinned Pratt pony truss Western Bridge Company
CASS24	217000.1	Coldwater Creek Bridge	1- 55' c 1910 pinned Pratt bedstead
CASS25	230001.7	Wolf Creek Bridge	1- 50' c 1915 pinned Pratt half-hip pony truss

CASS COUNTY

INCLUDED (cont.):

CASS26	265000.8	Wolf Creek Bridge	1- 40' c1910	pinned Pratt bedstead (replaced)
CASS27	282000.4	Camp Creek Bridge		
*CASS28	299000.3	Grand River Bridge	1- 98' c1880	bowstring pony arch-truss Mo. Valley B&I Works (prob.)
CASS29	300000.6	Price and Colburn Bridge	1- 80' 1910	pinned Pratt pony truss George Bird, Harrisonville MO (destroyed)
CASS30	329000.9	Wolf Creek Bridge		
CASS31	329001.3	East Branch Bridge	1- 70' c1910	pinned Pratt half-hip pony truss
*CASS32	338000.7	Russell Bridge	1- 24' 1905	pinned kingpost pony truss George Bird, Harrisonville MO
CASS33	342001.4	Eight Mile Creek Bridge	1- 34' c1905	pinned Pratt bedstead Western Bridge Company
CASS34	347000.5	East Fork Bridge	1- 70' c1910	pinned Pratt pony truss
*CASS35	361000.6	East Fork Bridge	1- 70' c1890	pinned Pratt through truss Kansas City Bridge Company
*CASS36	364000.4	Prewitt Bridge	1- 32' 1905	pinned kingpost pony truss George Bird, Harrisonville MO (replaced)
CASS37	369000.6	East Fork Bridge		
CASS38	382000.8	Eight Mile Creek Bridge	1- 50' 1918	pinned Pratt pony truss Western Bridge Company (replaced)
CASS39	385000.5	Camp Creek Bridge		
CASS40	386000.3	Camp Creek Bridge	1- 40' c1905	pinned Pratt bedstead
CASS41	392001.1	Campbell Bridge		(replaced)
CASS42	393001.7	Camp Creek Bridge	1- 48' 1912	pinned Pratt half-hip pony truss Canton Bridge Co., Canton OH
CASS43	394001.0	Crooked Creek Bridge	1- 40' c1905	pinned Pratt bedstead
CASS44	402002.2	Camp Creek Bridge		(destroyed)
CASS45	407000.4	Camp Creek Bridge	1- 68' c1915	pinned Pratt pony truss
CASS46	413001.2	Clear Creek Bridge		(replaced)
CASS47	438000.4	Sugar Creek Bridge		(replaced)
CASS48	450000.5	Big Creek Bridge	1- 50' c1905	pinned Pratt bedstead Western Bridge Company
CASS49	470001.4	Rocky Branch Bridge	1- 45' 1906	pinned Pratt bedstead Western Bridge Company
CASS50	480000.2	Walnut Creek Bridge	1- 30' c1905	pinned Pratt bedstead Western Bridge Company
*CASS51	485002.8	Bridge		(replaced)
*CASS52	488000.2	Harding Creek Bridge	1- 45' 1906	pinned Pratt bedstead Western Bridge Company
*CASS53	511001.0	South Fork Bridge	1- 70' c1905	pinned Pratt bedstead

CASS COUNTY

INCLUDED (cont.):

CASS54	530000.2	Black Creek Bridge	1- 35'	pinned Pratt bedstead
			c1905	
*CASS55	534002.2	Grand River Bridge	1- 64'	pinned Pratt through truss
			1884	Osage Bridge & Iron Works
*CASS56	540000.8	App Bridge	1- 40'	pinned Pratt bedstead
			1897	Farnsworth and Blodgett
CASS57	558002.0	Eight Mile Creek Bridge		(replaced)
CASS58	564000.5	Eight Mile Creek Bridge	1- 55'	pinned Pratt pony truss
			c1915	
CASS59	577001.5	Grand River Bridge	1-100'	riveted Warren pony truss
			c1930	
CASS60	587001.2	Sugar Creek Bridge	1- 60'	pinned Pratt pony truss
			c1915	
*CASS61	592001.9	Joslin Branch Bridge	1- 50'	pinned Pratt half-hip pony
			c1910	
CASS62	605001.7	Lick Creek Bridge	1- 50'	pinned Pratt bedstead
			c1905	
CASS63	606001.7	Lick Creek Bridge	1- 40'	pinned Pratt bedstead
			c1905	
CASS64	632001.6	Creighton Bridge		(replaced)
CASS65	659000.1	Massey Creek Bridge	1- 70'	pinned Pratt pony truss
			1919	Kansas City Bridge Company
*CASS66	none	Clark Bridge	1-	pinned Pratt through truss
			1880	Missouri Valley B&I Works

Archie Bridge

CASS01

GENERAL DATA

structure no.: H 453R1	city/town: Archie
county: Cass	feature inters.: South Grand River
	cadastral grid: S27/34, T43N, R31W
	highway route: U.S. Highway 71
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, variable depth, plate deck girder, skewed	
substructure: concrete abutments, wingwalls and piers	
span number: 3	condition: good
span length: 140.0'	alterations: superstructure replaced, 1951
total length: 325.0'	floor/decking : concrete deck over steel stringers
roadway width: 28.0'	other features: steel channel guardrails

HISTORICAL DATA

erection date: 1926; rebuilt 1951
erection cost: \$171,209.90
designer: Missouri State Highway Department
fabricator : unknown
contractor: Koch and McGlone (substructure); Knutson-Gould Construction Company, Kansas City MO (superstructure)
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number H 453R1; Primary System Bridge Record, located at the Missouri Highway and Transportation Department, Jefferson City MO; field inspection by Mark Hufstetler, 10 February 1991.
sign. rating: 38
evaluation: NRHP non-eligible (long-span example of MSHD beam bridge type, built relatively late and not exceptionally significant)

inventoried by: Mark Hufstetler 27 August 1992

CRI&P Railroad Overpass

CASS02

GENERAL DATA

structure no.: L 23R	city/town: 1.1 miles south of Baldwin Park
county: Cass	feature inters.: Chicago, Rock Island & Pacific Railroad
	cadastral grid: S29, T46N, R30W
	highway route: State Highway 7
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, 10-panel, rigid-connected Parker through truss	
substructure: concrete abutments, wingwalls and piers	
span number: 1	condition: fair
span length: 260.0'	alterations: none
total length: 481.0'	floor/decking : concrete deck over steel stringers
roadway width: 26.0'	other features: upper chord and inclined end post: 2 channels with cover plates; lower chord, vertical and diagonal: 4 angles; lateral bracing: 2 angles with batten plates; floor beam: I-beam, field-bolted to verticals; guardrail: concrete

HISTORICAL DATA

erection date: 1948	
erection cost: \$215,870.15	
designer: Missouri State Highway Department	
fabricator : unknown	
contractor : Perry McGlone Construction Company	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number L 23R; Files on primary system bridges located at the Missouri Highway and Transportation Department, Jefferson City MO; field inspection by Mark Hufstetler, 10 February 1991.	
sign. rating: 39	
evaluation: NRHP non-eligible (long-span example of MSHD truss design, not exceptionally significant)	

inventoried by: Mark Hufstetler 27 August 1992

Bridge

CASS04

GENERAL DATA

structure no.:	058001.1	city/town:	4.2 miles northeast of Raymore
county:	Cass	feature inters.:	branch of Middle Creek
		cadastral grid:	S8, T46N, R31W
		highway route:	County Road 58
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 3-panel, pin-connected Pratt truss-leg bedstead		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	fair
span length:	45.0'	alterations:	unknown
total length:	48.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	unknown

HISTORICAL DATA

erection date:	c1910
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor :	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 058001.1.

sign. rating:	25
evaluation:	NRHP non-eligible (typically configured, inadequately documented example of relatively common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Bridge

CASS05

GENERAL DATA

structure no.:	073000.6	city/town:	2.2 miles northwest of Pleasant Hill
county:	Cass	feature inters.:	branch of Big Creek
		cadastral grid:	S12, T46N, R31W
		highway route:	County Road 73
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure: steel, pin-connected Pratt truss-leg bedstead
substructure: steel truss-leg abutments with timber backwalls

span number:	1	condition:	fair
span length:	60.0'	alterations:	unknown
total length:	60.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	timber guardrails

HISTORICAL DATA

erection date: c1905
erection cost: unknown
designer: unknown
fabricator : unknown
contractor : unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 073000.6.

sign. rating: 29
evaluation: NRHP non-eligible (typically configured, inadequately documented example of relatively common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Big Creek Bridge

CASS06

GENERAL DATA

structure no.: 078001.3	city/town: 3.7 miles northwest of Pleasant Hill
county: Cass	feature inters.: Middle Big Creek
	cadastral grid: S22, T46N, R31W
	highway route: County Road 78
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 5-panel, pin-connected Pratt pony truss, with steel stringer approach spans	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 80.0'	alterations: unknown
total length: 116.0'	floor/decking : timber deck
roadway width: 12.8'	other features: steel angle guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 078001.3.

sign. rating: 30
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

Inventoried by: Mark Hufstetler 27 August 1992

Duncan Creek Bridge

CASS07

GENERAL DATA

structure no.:	109000.0	city/town:	2.4 miles southeast of Pleasant Hill
county:	Cass	feature inters.:	Duncan Creek
		cadastral grid:	S28, T46N, R30W
		highway route:	County Road 109
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt half-hip pony truss
substructure: unknown

span number:	1	condition:	fair
span length:	65.0'	alterations:	unknown
total length:	66.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	timber guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 109000.0.

sign. rating: 28
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Big Creek Bridge

CASS08

GENERAL DATA

structure no.:	112000.4	city/town:	3.0 miles southeast of Pleasant Hill
county:	Cass	feature inters.:	Big Creek
		cadastral grid:	S33/34, T46N, R30W
		highway route:	County Road 112
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 4-panel, pin-connected Pratt pony truss		
substructure:	unknown		
span number:	1	condition:	fair
span length:	60.0'	alterations:	unknown
total length:	60.0'	floor/decking :	timber deck
roadway width:	12.0'	other features:	timber guardrails

HISTORICAL DATA

erection date:	c1910
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor:	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 112000.4.

sign. rating:	28
evaluation:	NRHP non-eligible (typically configured, inadequately documented example of common structural type)

Inventoried by: Mark Hufstetler 27 August 1992

Camp Creek Bridge

CASS09

GENERAL DATA

structure no.: 117000.5	city/town: 4.9 miles northeast of Harrisonville
county: Cass	feature inters.: Camp Creek
	cadastral grid: S18/19, T45N, R30W
	highway route: County Road 117
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt pony truss	
substructure: unknown	
span number: 1	condition: fair
span length: 55.0'	alterations: unknown
total length: 55.0'	floor/decking : concrete deck over steel stringers
roadway width: 14.0'	other features: steel angle guardrails

HISTORICAL DATA

erection date: c1915
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 117000.5.

sign. rating: 25
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Templeton Bridge

CASS12

GENERAL DATA

structure no.:	140000.6	city/town:	0.8 mile east of Strasburg
county:	Cass	feature inters.:	East Creek
		cadastral grid:	S29, T46N, R29W
		highway route:	County Road 140
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 3-panel, pin-connected Pratt truss-leg bedstead, with steel stringer approach spans		
substructure:	steel truss-leg piers		
span number:	1	condition:	fair
span length:	40.0'	alterations:	unknown
total length:	58.0'	floor/decking :	timber deck
roadway width:	14.1'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1905
erection cost:	\$270.00 (erection cost)
designer:	unknown
fabricator :	unknown
contractor:	George Bird, Harrisonville MO (probable)
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 140000.6; Cass County Court Record, Book S: page 175 (5 May 1905) - located at the Cass County Courthouse, Harrisonville MO.
sign. rating:	37
evaluation:	NRHP non-eligible (typical, small-scale example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Crawford Creek Bridge

CASS14

GENERAL DATA

structure no.:	149001.1	city/town:	2.0 miles southeast of Strasburg
county:	Cass	feature inters.:	Crawford Creek
		cadastral grid:	S5, T45N, R29W
		highway route:	County Road 149
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 4-panel, pin-connected Pratt pony truss		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	fair
span length:	55.0'	alterations:	unknown
total length:	56.0'	floor/decking :	timber deck
roadway width:	12.0'	other features:	timber guardrails

HISTORICAL DATA

erection date:	c1890
erection cost:	unknown
designer:	Kansas City Bridge and Iron Company, Kansas City MO
fabricator :	Kansas City Bridge and Iron Company, Kansas City MO
contractor :	Kansas City Bridge and Iron Company, Kansas City MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 149001.1.
sign. rating:	35
evaluation:	NRHP non-eligible (typically configured, inadequately documented example of common structural type)

Inventoried by: Mark Hufstetler 27 August 1992

Crawford Creek Bridge

CASS16

GENERAL DATA

structure no.:	162001.2	city/town:	3.0 miles southeast of Strasburg
county:	Cass	feature inters.:	Crawford Creek
		cadastral grid:	S8, T45N, R29W
		highway route:	County Road 162
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 3-panel, pin-connected Pratt truss-leg bedstead		
substructure:	steel truss-leg abutments with timber backwalls		
span number:	1	condition:	fair
span length:	45.0'	alterations:	unknown
total length:	48.0'	floor/decking :	timber deck over steel stringers
roadway width:	14.0'	other features:	unknown

HISTORICAL DATA

erection date:	c1900
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor :	S.B. Coutts, Harrisonville MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 162001.2.
sign. rating:	32
evaluation:	NRHP non-eligible (typical example of common structural type)

Inventoried by: Mark Hufstetler 27 August 1992

Crawford Creek Bridge

CASS17

GENERAL DATA

structure no.: 165000.0	city/town: 2.4 miles north of Gunn City
county: Cass	feature inters.: Crawford Creek
	cadastral grid: S17/20, T45N, R29W
	highway route: County Road 165
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt half-hip pony truss	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 60.0'	alterations: unknown
total length: 60.0'	floor/decking : timber deck
roadway width: 13.8'	other features: steel angle guardrails

HISTORICAL DATA

erection date: 1910
erection cost: \$1450.00
designer: Canton Bridge Company, Canton OH
fabricator : Canton Bridge Company, Canton OH
contractor: Canton Bridge Company, Canton OH
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 165000.0; Cass County Court Record, Book U: page 101 (8 October 1910) -located at the Cass County Court-house, Harrisonville MO.
sign. rating: 40
evaluation: NRHP non-eligible (typically configured example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Massey Creek Bridge

CASS18

GENERAL DATA

structure no.:	170004.1	city/town:	1.2 miles northeast of Cleveland
county:	Cass	feature inters.:	Massey Creek
		cadastral grid:	S27/28, T45N, R33W
		highway route:	County Road 170
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 4-panel, pin-connected Pratt pony truss, with steel stringer approach spans		
substructure:	concrete abutments, wingwalls and piers		
span number:	1	condition:	fair
span length:	55.0'	alterations:	unknown
total length:	81.0'	floor/decking :	timber deck
roadway width:	13.8'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	c1910
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor:	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 170004.1.

sign. rating:	25
evaluation:	NRHP non-eligible (typical example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Town Creek Bridge

CASS19

GENERAL DATA

structure no.:	187000.2	city/town:	Harrisonville
county:	Cass	feature inters.:	Town Creek
		cadastral grid:	S28, T45N, R31W
		highway route:	County Road 187
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure: steel, 2-panel, pin-connected Pratt half-hip pony truss
substructure: concrete abutments and wingwalls

span number:	1	condition:	fair
span length:	25.0'	alterations:	unknown
total length:	26.0'	floor/decking :	timber deck
roadway width:	12.0'	other features:	timber guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 187000.2.

sign. rating: 20
evaluation: NRHP non-eligible (typical, small-scale example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Massey Creek Bridge

CASS20

GENERAL DATA

structure no.:	191000.2	city/town:	1.2 miles southeast of Cleveland
county:	Cass	feature inters.:	Branch of Massey Creek
		cadastral grid:	S33/34, T45N, R33W
		highway route:	County Road 191
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 4-panel, pin-connected Pratt half-hip pony truss		
substructure:	unknown		
span number:	1	condition:	fair
span length:	75.0'	alterations:	unknown
total length:	75.0'	floor/decking :	timber deck over steel stringers
roadway width:	14.0'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1910
erection cost:	\$1293.00
designer:	Western Bridge Company, Harrisonville MO
fabricator :	Western Bridge Company, Harrisonville MO
contractor :	Western Bridge Company, Harrisonville MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 191000.2; Cass County Court Record, Book U: page 101 (8 October 1910) -located at the Cass County Courthouse, Harrisonville MO.
sign. rating:	38
evaluation:	NRHP non-eligible (typical example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Massey Creek Bridge

CASS22

GENERAL DATA

structure no.: 194000.4	city/town: 3.7 miles northeast of Cleveland
county: Cass	feature inters.: Massey Creek
	cadastral grid: S25, T45N, R33W
	highway route: County Road 194
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 6-panel, pin-connected Pratt through truss, with steel stringer approach spans

substructure: stone masonry abutments, wingwalls and piers

span number: 1	condition: fair
span length: 85.0'	alterations: unknown
total length: 143.0'	floor/decking : timber deck over steel stringers
roadway width: 14.0'	other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: I-beam; diagonal: 2 punched rectangular eyebars; counter: round rod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 4 angles with double lacing; floor beam: I-beam, U-bolted to lower chord pins; guardrail: timber

HISTORICAL DATA

erection date: c1890
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 194000.4; field inspection by Mark Hufstetler, 10 February 1991.

sign. rating: 34
evaluation: NRHP non-eligible (well-preserved, early example of mainstay structural type, lacking definitive documentation)

inventoried by: Mark Hufstetler 27 August 1992

Lusher Bridge

CASS23

GENERAL DATA

structure no.:	213000.6	city/town:	4.6 miles southwest of Freeman
county:	Cass	feature inters.:	Harless Creek
		cadastral grid:	S29, T44N, R33W
		highway route:	County Road 213
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt pony truss
substructure: concrete abutments and wingwalls

span number:	1	condition:	fair
span length:	40.0'	alterations:	unknown
total length:	40.0'	floor/decking :	timber deck
roadway width:	12.0'	other features:	steel angle guardrails

HISTORICAL DATA

erection date: 1911
erection cost: \$585.00
designer: Western Bridge Company, Harrisonville MO
fabricator : Western Bridge Company, Harrisonville MO
contractor: Western Bridge Company, Harrisonville MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 213000.6; Cass County Court Record, Book U: page 117 (9 November 1910), page 173 (3 January 1911) - located at the Cass County Courthouse, Harrisonville MO.

sign. rating: 35
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Coldwater Creek Bridge

CASS24

GENERAL DATA

structure no.: 217000.1	city/town: 4.3 miles southwest of Freeman
county: Cass	feature inters.: Coldwater Creek
	cadastral grid: S34, T44N, R33W
	highway route: County Road 217
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt bedstead
substructure: concrete abutments and wingwalls

span number: 1	condition: fair
span length: 55.0'	alterations: unknown
total length: 80.0'	floor/decking : timber deck
roadway width: 14.0'	other features: timber guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor : unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 217000.1.

sign. rating: 25
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Wolf Creek Bridge

CASS25

GENERAL DATA

structure no.: 230001.7	city/town: 6.4 miles northwest of Harrisonville
county: Cass	feature inters.: Wolf Creek
	cadastral grid: S12, T45N, R32W
	highway route: County Road 230
	highway distr.: 4
	current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt half-hip pony truss	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 50.0'	alterations: unknown
total length: 52.0'	floor/decking : concrete deck over steel stringers
roadway width: 14.0'	other features: steel angle guardrails

HISTORICAL DATA

erection date: c1915
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 230001.7.

sign. rating: 25
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Wolf Creek Bridge

CASS26

GENERAL DATA

structure no.:	265000.8	city/town:	3.0 miles northwest of Harrisonville
county:	Cass	feature inters.:	Wolf Creek
		cadastral grid:	S31, T45N, R31W
		highway route:	County Road 265
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 3-panel, pin-connected Pratt truss-leg bedstead, with timber stringer approach spans		
substructure:	steel truss-leg piers		
span number:	1	condition:	fair
span length:	40.0'	alterations:	unknown
total length:	56.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	steel angle guardrails

erection date:	c1910
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor :	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 265000.8.

sign. rating:	25
evaluation:	NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Grand River Bridge

CASS28

GENERAL DATA

structure no.: 299000.3 city/town: 0.9 mile north of Freeman
county: Cass feature inters.: Massey Creek
cadastral grid: S12, T44N, R33W
highway route: County Road 299
highway distr.: 4
current owner: Cass County

STRUCTURAL DATA

superstructure: wrought iron, 9-panel bowstring pony arch-truss
substructure: stone abutments and wingwalls

span number: 1 condition: fair
span length: 98.0' alterations: deck and floor structure replaced
total length: 98.0' floor/decking : timber deck over steel stringers
roadway width: 13.7' other features: arch rib: box girder comprised of two channels
with top and bottom cover plates; lower chord:
2 rectangular eyebars; vertical: 2 round rods,
threaded into cast iron skewback; diagonal:
round rod, threaded into cast iron skewback;
lateral bracing: round rod with turnbuckle;
floor beam: I-beam, clamped to lower chord;
guardrail: timber

HISTORICAL DATA

erection date: c1875
erection cost: unknown
designer: Missouri Valley Bridge and Iron Company, Leavenworth KS (probable)
fabricator : Missouri Valley Bridge and Iron Company, Leavenworth KS (probable)
contractor: Missouri Valley Bridge and Iron Company, Leavenworth KS (probable)

references: Missouri Highway and Transportation Department, Structure Inventory
and Appraisal: Structure Number 299000.3; field inspection by Mark
Hufstetler, 10 February 1991.

sign. rating: 81
evaluation: NRHP eligible (one of the last examples in Missouri of earliest mass-
produced iron bridge type)

inventoried by: Mark Hufstetler 27 August 1992

Price and Colburn Bridge

CASS29

GENERAL DATA

structure no.:	300000.6	city/town:	Freeman
county:	Cass	feature inters.:	Massey Creek
		cadastral grid:	S7, T44N, R32W
		highway route:	County Road 300
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, 5-panel, pin-connected Pratt pony truss, with steel stringer approach spans		
substructure:	concrete-filled steel cylinder piers		
span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	142.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1910
erection cost:	\$2300.00
designer:	unknown
fabricator :	unknown
contractor:	George Bird, Harrisonville MO

sign. rating:	40
evaluation:	NRHP non-eligible (typical example of common structural type)

Inventoried by: Mark Hufstetler 27 August 1992

East Branch Bridge

CASS31

GENERAL DATA

structure no.:	329001.3	city/town:	2.9 miles northwest of Harrisonville
county:	Cass	feature inters.:	East Branch
		cadastral grid:	S1, T44N, R32W
		highway route:	County Road 329
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt half-hip pony truss
substructure: unknown

span number:	1	condition:	fair
span length:	70.0'	alterations:	unknown
total length:	71.0'	floor/decking :	timber deck
roadway width:	13.8'	other features:	steel angle guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 329001.3.

sign. rating: 28
evaluation: NRHP non-eligible (typically configured, inadequately documented example of common structural type)

inventoried by: Mark Hufstetler 27 August 1992

Russell Bridge

CASS32

GENERAL DATA

structure no.:	338000.7	city/town:	3.5 miles southeast of Harrisonville
county:	Cass	feature inters.:	Eight Mile Creek
		cadastral grid:	S1/12, T44N, R30/31W
		highway route:	County Road 338
		highway distr.:	4
		current owner:	Cass County

STRUCTURAL DATA

superstructure:	steel, pin-connected kingpost pony truss		
substructure:	steel pile bent abutments with timber back- and wingwalls		
span number:	1	condition:	fair
span length:	24.0'	alterations:	unknown
total length:	24.0'	floor/decking :	timber deck over steel stringers
roadway width:	14.0'	other features:	inclined end post: 2 channels with cover and batten plates; lower chord: 2 looped rectangular eyebars; vertical: 4 angles with lacing; lateral bracing: round rod with threaded ends; floor beam: I-beam, field-bolted to vertical

HISTORICAL DATA

erection date:	1905
erection cost:	\$417.00
designer:	unknown
fabricator :	unknown
contractor :	George Bird, Harrisonville MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 338000.7; Cass County Court Record, Book S: page 175 (5 May 1905) - located at the Cass County Courthouse, Harrisonville MO; field inspection by Lon Johnson, 10 February 1991.
sign. rating:	48
evaluation:	NRHP potentially eligible (now-rare example of what was once a ubiquitous structural type)

inventoried by: Mark Hufstetler 27 August 1992

Eight Mile Creek Bridge

CASS33

GENERAL DATA

structure no.: 342001.4 **city/town:** 4.0 miles southeast of Harrisonville
county: Cass **feature inters.:** Eight Mile Creek
cadastral grid: S7/12, T44N, R30/31W
highway route: County Road 342
highway distr.: 4
current owner: Cass County

STRUCTURAL DATA

superstructure: steel, 2-panel, pin-connected Pratt truss-leg bedstead, with steel stringer approach spans
substructure: steel truss-leg piers

span number: 1 **condition:** fair
span length: 34.0' **alterations:** unknown
total length: 62.0' **floor/decking :** timber deck over steel stringers
roadway width: 12.0' **other features:** timber guardrails

This single-span truss carries County Road 193 over Massey Creek in western Cass County. Comprised of a pinned Pratt pony truss, supported by a concrete substructure and approached by steel stringer spans, the Hall Bridge - as it was locally known - was erected in 1904. In May of that year the Cass County Court directed the county road and bridge commissioner to draw up plans and specifications, estimate the cost, and solicit bids for this bridge and five others around the county. The court in June contracted for four of the medium-span structures with Harrisonville, Missouri, contractor George Bird. It was not until August, however, that the county hired Bird to build the bridge near Joe Hall's farm for \$1125.00. Bird used a pinned truss fabricated by the Canton Bridge Company of Canton, Ohio, completing it later that year. The Hall Bridge lasted less than a year before it required a major reconstruction of its substructure. In October 1905 the county purchased new steel cylinder piers to place under the existing truss. These piers were later replaced with a concrete substructure, but the truss remains intact, as the Hall Bridge continues to function in place at this rural Union Township crossing. It is a typically configured example of a mainstay structural type in Missouri - the Pratt pony truss.

superstructure: wrought iron, 9-panel bowstring pony arch-truss
substructure: stone abutments and wingwalls
floor/decking: timber deck over steel stringers
other features: arch rib: box girder comprised of two channels with top and bottom cover plates; lower chord: 2 rectangular eyebars; vertical: 2 round rods, threaded into cast iron skewback; diagonal: round rod, threaded into cast iron skewback; lateral bracing: round rod with turnbuckle; floor beam: I-beam, clamped to lower chord; guardrail: timber

Located just north of Freeman, this bowstring arch-truss carries what was once the main road west from Harrisonville over the North Fork of the Grand River (now called Massey Creek). The timber-decked bridge features a wrought iron 98-foot truss, supported by cut stone abutments. The truss bears the earmarks of early 1870s fabrication by the Missouri Valley Bridge and Iron Company of Leavenworth, Kansas. Although Missouri Valley was active in Cass County during this period, no specific references to a bridge at this crossing have been located in the Cass County Court Record. The date, therefore, must be approximated. The iron superstructure of the bridge remains intact, but the deck and floor system have evidently been replaced.

The bowstring arch-truss was the iron span of choice for Missouri counties in the late 1860s and 1870s. Marketed extensively by such industry giants as the Wrought Iron Bridge Company, the King Iron Bridge Company of Ohio and the Missouri Valley Bridge and Iron Works of Kansas, these often-patented bridge forms featured a wide range of span lengths, economical fabrication cost and relatively quick erection. The proliferation of the bowstring coincided with the initial development of Missouri's road system, and as a result, perhaps thousands of these prototypical iron spans were erected throughout the state. The bowstring design had some rather severe structural flaws, however, and it was superseded by the pin-connected truss in the early 1880s. Through subsequent attrition, almost all of Missouri's bowstrings have since been replaced and demolished. Now only a half-dozen remain in place, two of which use pony configurations. One of the last of its kind still functioning as designed, the Grand River Bridge in Cass County is a significant resource in the interpretation of Missouri transportation development.

other features: inclined end post: 2 channels with cover and batten plates; lower chord: 2 looped rectangular eyebars; vertical: 4 angles with lacing; lateral bracing: round rod with threaded ends; floor beam: I-beam, field-bolted to vertical

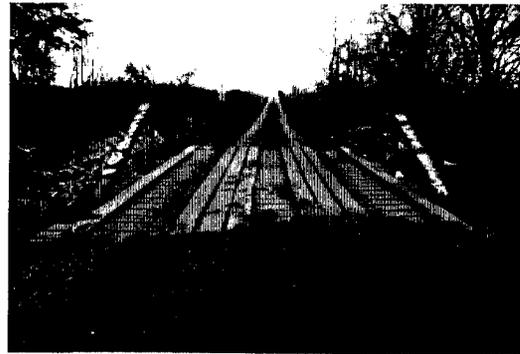

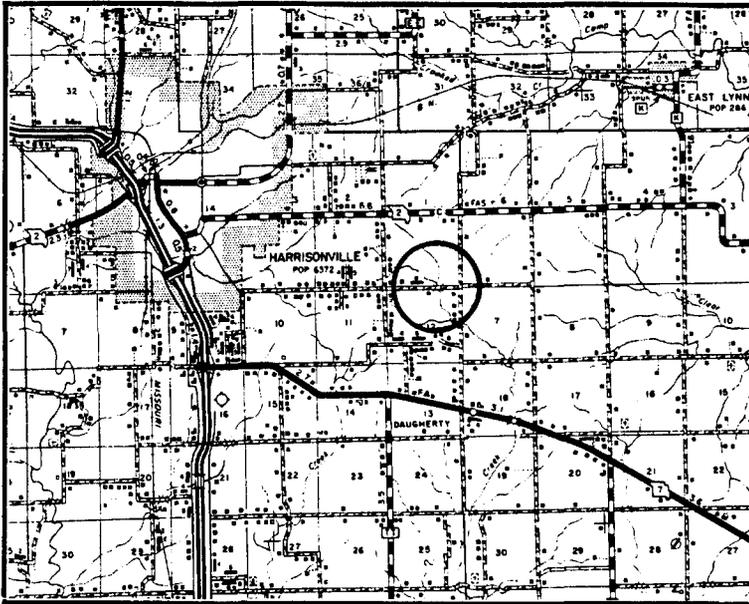

Dating to 1905, this small-scale truss spans Eight Mile Creek some three miles southeast of Harrisonville, in central Cass County. The bridge consists of a kingpost pony truss supported by steel pile bent abutments with timber backwalls. Known locally as the Russell Bridge, it was constructed in 1905 by George Bird, a contractor based in nearby Harrisonville. The Cass County Court hired Bird that May to build this structure for \$417.00 and several other small steel spans. Since its completion later that year, the Russell Bridge has functioned in place, with no substantial alterations.

With its roots extending to the middle ages, the kingpost pony truss is the most rudimentary truss type. Numerous kingposts were built on Missouri's early roads in the 19th century, executed first as timber/iron combination structures and later in all-metal configurations. The kingpost as a structural type was limited to relatively short-span applications, however, and as steel beam bridges received widespread acceptance after the turn of the century, erection of kingpost trusses declined rapidly. This bridge in Cass County is an unusually late example of all-steel kingpost fabrication. Its technological significance is enhanced by its well-preserved physical condition and by the fact that almost all of the once-numerous kingpost trusses in Missouri have since been demolished.

span number: 1
span length: 70.0'
total length: 104.0'
roadway wdt.: 14.0'

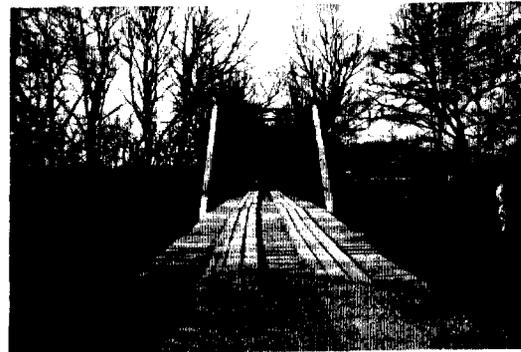

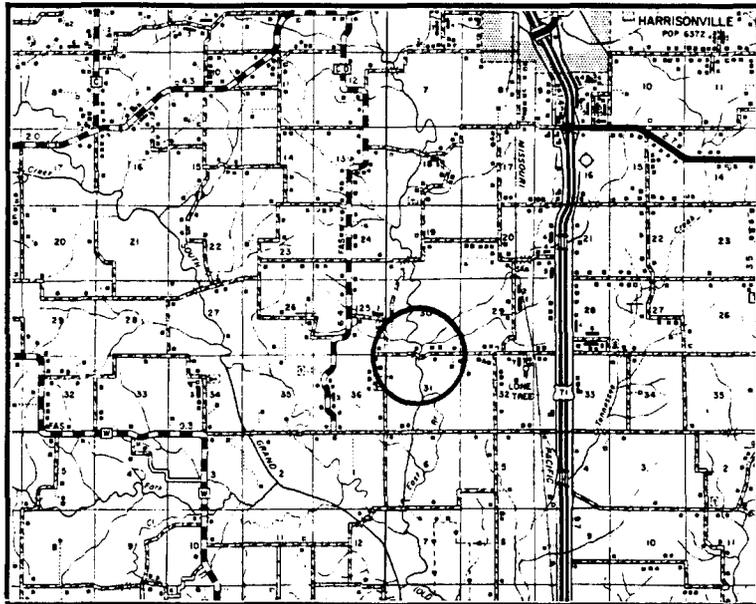

superstructure: wrought iron, 5-panel, pin-connected Pratt through truss, with 2 timber stringer approach spans
substructure: concrete-filled iron cylinder piers; timber pile bent piers and abutments at approach spans
floor/decking: timber deck over timber stringers
other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched eyebars; vertical: 2 channels with lacing; diagonal: 2 punched rectangular eyebars; counter: round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: I-beam; floor beam: riveted plate girder, U-bolted to lower chord pins; guardrail: twisted cable

Located in south-central Cass County, six miles south of Harrisonville, this Pratt through truss spans the East Fork of the Grand River. This truss features pin-connected detailing and wrought iron web members typical for the late 1880s and early 1890s. Builder's plates on the truss's portals indicate that it was fabricated by the Kansas City Bridge and Iron Company, which was active in Cass County during this period. County records have failed to provide definitive documentation of the bridge's construction, however. The East Fork Bridge continues to carry traffic at this rural crossing, although its portals on both ends have been heavily damaged due to collision by tall vehicles. It is a representative early example of a mainstay structural type for Missouri: the pinned Pratt through truss.

span number: 1	superstructure: steel, pin-connected kingpost pony truss
span length: 32.0'	substructure: steel pile bent abutments and timber back- and wingwalls
total length: 32.0'	floor/decking: timber deck over timber stringers
roadway wdt.: 13.8'	other features: inclined end post: 2 channels with cover and batten plates; lower chord: 2 looped rectangular eyebars; vertical: 4 angles with lacing; lateral bracing: round rod with threaded ends; floor beam: I-beam, field-bolted to verticals; guardrail: timber

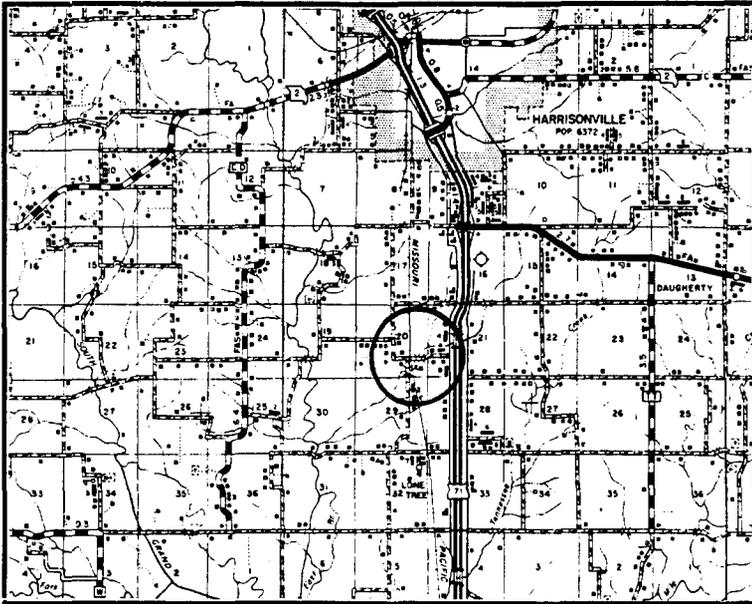

This pin-connected kingpost pony truss spans the East Fork of the Grand River about four miles south of Harrisonville, in south-central Cass County. Known locally as the Prewitt Bridge, the small-scale structure is supported by I-beam pile abutments with timber backwalls and guardrails. It was constructed in 1905 by George Bird, a contractor based in nearby Harrisonville. The Cass County Court hired Bird that May to build this structure for \$440.00, the Russell Bridge [CASS32], and several other small steel spans. Since its completion later that year, the Prewitt Bridge has functioned in place, with the replacement of its center floor beam and addition of steel outriders as the only alteration of note.

The kingpost configuration is simple, consisting of a single triangle with reinforcing timber or steel members. With its roots extending to the middle ages, the kingpost is the most rudimentary truss type. Numerous kingposts were built on Missouri's early roads in the 19th century, executed first as timber/iron combination structures and later in all-metal configurations. The kingpost as a structural type was limited to relatively short-span applications, however, and as steel beam bridges received widespread acceptance after the turn of the century, erection of kingpost trusses declined rapidly. This bridge in Cass County is an unusually late example of all-steel kingpost fabrication. Its technological significance is enhanced by its well-preserved physical condition and by the fact that almost all of the once-numerous kingpost trusses in Missouri have since been demolished.

span number: 1
span length: 64.0'
total length: 153.0'
wdt.: 13.8'

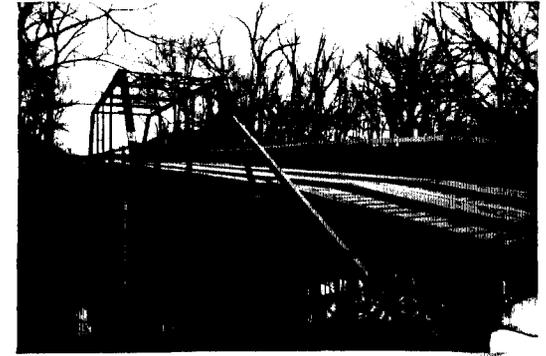

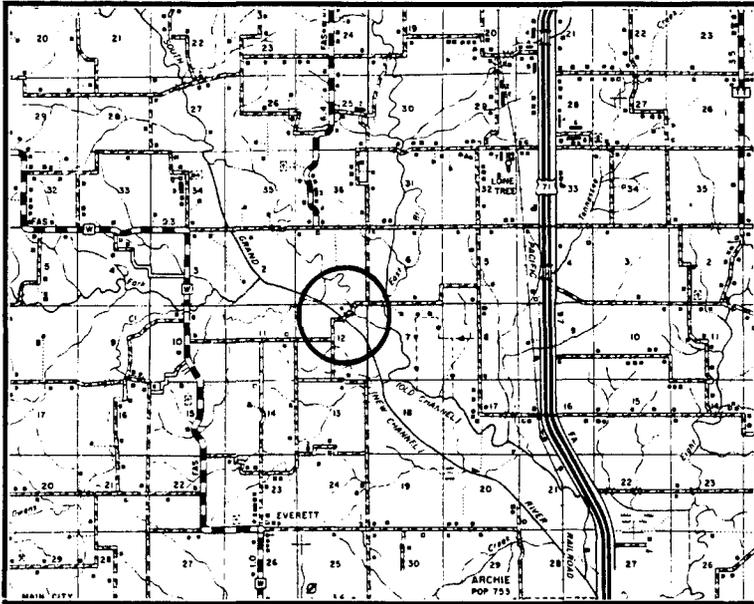

superstructure: wrought iron, 6-panel, pin-connected Pratt through truss, with steel stringer approach spans
substructure: concrete spill-through piers under truss; timber pile bent abutments and piers at roadway approaches
floor/decking: timber deck over timber stringers
other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: I-beam; diagonal: 2 punched rectangular eyebars; lateral bracing: round rod with threaded ends; strut: I-beam; floor beam: I-beam, U-bolted to lower chord pins; guardrail: timber

This short-span through truss spans the New Channel of the Grand River northwest of Archie, in south-central Cass County. The bridge features a single pinned Pratt truss, supported by concrete spill-through piers, with steel stringer approach spans. The truss was reportedly moved to this location in 1929, at which time the concrete substructure and approach spans were built. It had been fabricated in 1884 by the obscure Osage Bridge and Iron Works. Cass County records do not record any dealings with Osage B&I at that time, indicating that the truss was moved here from another county. This move and the clouded origins of the truss limit its interpretive value, as does its relatively poor physical integrity. The Grand River Bridge is thus an early, though not particularly significant, example of a Missouri mainstay structural type - the pinned Pratt through truss.

superstructure: steel, 3-panel, pin-connected Pratt truss-leg bedstead, with steel deck girder approach spans
substructure: steel truss-leg piers, with concrete abutments and wingwalls
floor/decking: timber deck over steel girders
other features: upper chord and upright end post: 2 channels with lacing; lower chord: 2 angles with batten plate or 2 rectangular eyebars; vertical: 4 angles with lacing; diagonal: 2 rectangular eyebars; lateral bracing: round rod with threaded ends; floor beam: I-beams, U-bolted to lower chord pins; guardrail: timber

Located over Black Creek in extreme southern Cass County, this small-scale bridge was constructed in 1897 by the Kansas City-based contractors Farnsworth and Blodgett. The structure functioned for years as a truss-leg bedstead, with stringer approach spans on both ends. More recently, however, the abutments have been replaced with concrete, and deep steel girders have replaced the original floor system. The original trussed superstructure has thus been superseded by the new girders, rendering them structurally redundant. The App Bridge, as it was called in 1911, is thus a poorly preserved, early example of a Missouri mainstay structural type.

roadway wdt.:	unknown	other features:	upper chord and inclined end post: 2 channels with cover and batten plates; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing; diagonal: 2 punched rectangular eyebars; counter: round eyerod with unslotted turnbuckle; lateral bracing: round rod with threaded ends; strut: I-beam; floor beam: I-beam, U-bolted to lower chord pins; portal builder's plate: MO. VALLEY BRIDGE & IRON WORKS / 1880 / INSLEY SHIRE & C^o / LEAVENWORTH, KANS.

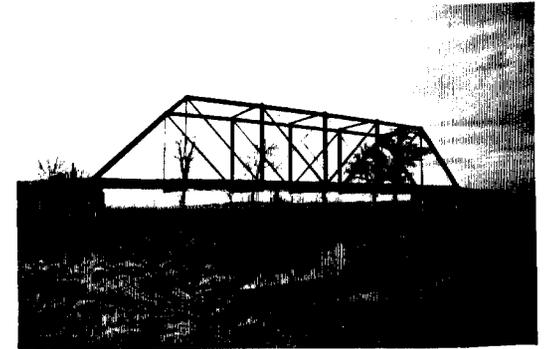

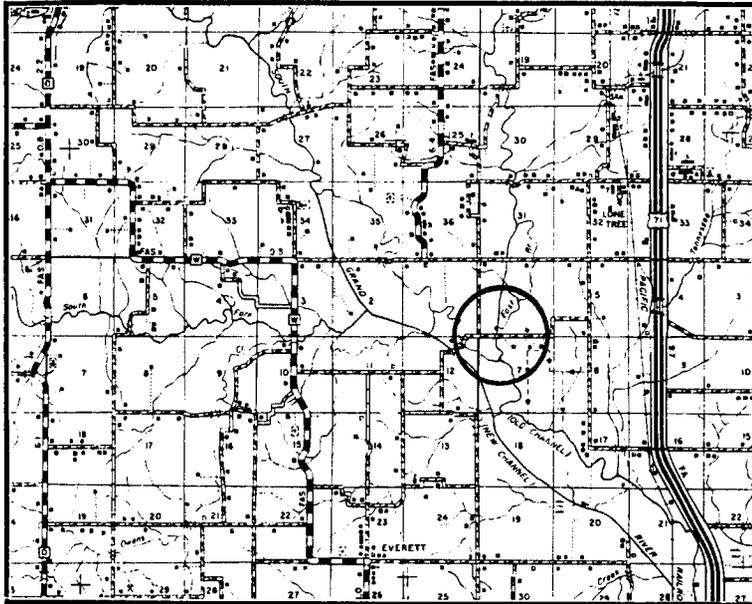

The Clark Bridge spans the original channel of the Grand River on a vacated county road in western Cass County. Located on the main north-south route through Cass County, the crossing was a strategic one during the county's early development, and the present iron Pratt truss is at least the second bridge to occupy this site. An early combination truss was already experiencing difficulties by the late 1870s, when the county undertook repeated substructural and superstructural repairs to keep it open. Finally, in December 1879, owing to unspecified damage, S.E. Lickliger was ordered by the court to auction off the bridge, which was lying prostrate in the stream. Adverse weather forced Lickliger to postpone the outdoor sale in order to give "interested parties a chance to come to it." But at the re-scheduled auction "the weather continued unfavorably and a rise in the river was expected hourly," he reported. "It appeared that no one wanted to invest unless I would be responsible for flood [damage to the truss in the river] and as a result no bids were received. Finally H.H. Parish said he would raise the Burford bid [\$20] five dollars and that was all he would give."

The county accepted the paltry bid, appropriating \$1000.00 for the erection of a new all-iron truss on the existing stone abutments in February 1880. The judges approved plans and specifications drafted by county road commissioner F.E. Bybee; in April they awarded the contract to fabricate and erect the replacement span to the Missouri Valley Bridge and Iron Works of Leavenworth, Kansas. The bridge was to be completed by July 10, 1880, according to the written agreement. Completing the structure before the contractual deadline, Mo Valley was issued a warrant for \$1450.00. Since its completion, the wrought iron bridge has carried traffic across the Grand River in essentially unaltered condition. It has more recently been closed to traffic and has been allowed by the county to molder in place.

In the early 1880s, the pin-connected Pratt truss superseded the bowstring arch-truss as the iron bridge of choice for medium-span wagon crossings. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design is distinguished by vertical members acting in compression and diagonals that act in tension. "The Pratt truss is the type most commonly used in America for spans under two hundred and fifty (250) feet in length," noted bridge engineer J.A.L. Waddell wrote in 1916. "Its advantages are simplicity, economy of metal, and suitability for connecting to the floor and lateral systems." Virtually all of the major regional bridge fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties. The Missouri Valley Bridge and Iron Works was a major player in western Missouri during the late 19th century, and the Clark Bridge represents that company's penchant for pinned truss construction. With an erection date of 1880, the Clark Bridge is distinguished as the oldest originally placed Pratt truss remaining in Missouri. It is thus a technologically and historically significant, well-preserved, transportation-related resource: one of the most important of the state's early spans.

total length:	55.0'	floor/decking:	concrete over earth fill
roadway wdt.:	18.0'	other features:	concrete guardrails with recessed rectangular panels

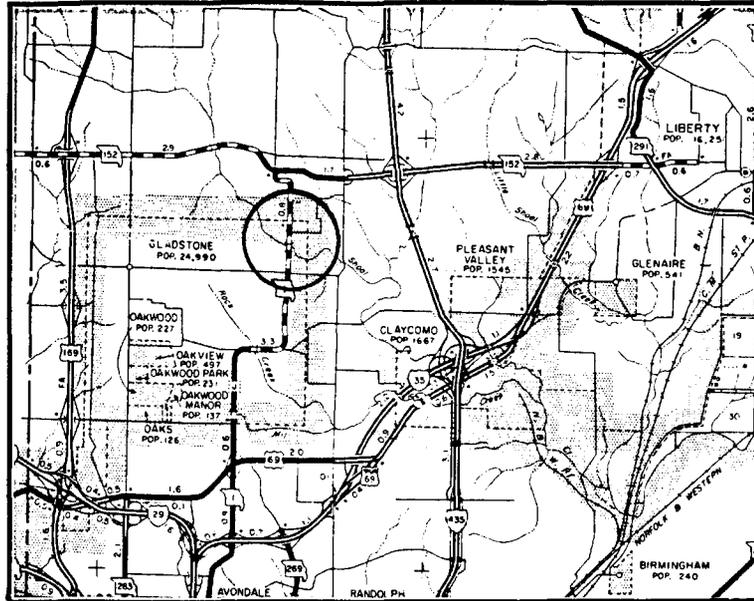

This medium-scale concrete arch bridge carries North Agnes Avenue over Shoal Creek in Gladstone. The structure consists of a single filled spandrel arch on concrete abutments, featuring plainly detailed concrete guardrails with recessed rectangular panels. The Shoal Creek Bridge dates to 1920. In April of that year the Clay County Court directed the county surveyor to prepare a cost estimate and specifications for this bridge, one over Carroll Creek [CLAY12] and three other spans. The county solicited competitive bids for the bridges, and in June proposals were received from five bridge companies: the Topeka Bridge and Construction Company, the Kansas City Bridge Company, Walt Archer, C.G. Hamilton, and the Phillips Contracting Company of Buckner, Missouri. Low bidder at \$7295.00, Phillips received the contract to build the Shoal Creek Bridge. The contractor reportedly completed the bridge in 1921. Since that time it has functioned in place, with no major alterations.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. Of the more than 13,000 pre-1951 bridges identified in Missouri by the statewide historic bridge inventory, only about 85 are filled spandrel concrete arches. These break down into roughly three equal groups: arches built to carry urban streets, those built by the state highway department in the 1920s and 1930s to carry highways and those built by the counties at rural county road crossings. The Shoal Creek Bridge falls into the third category. With its 55-foot span and 1920-21 construction date, it is among the longer and older of these rural county arches. The Shoal Creek Bridge does not display any features that could be regarded as technologically superlative. Rather, the bridge derives its significance from its representation of the broad trend of concrete bridge construction in Missouri. As a well-preserved and well-documented early concrete arch—designed by a county engineer as the state highway department was just beginning to draft standardized plans—the Shoal Creek Bridge is an important transportation-related resource.

Linking the Northeast Industrial section of Kansas City, Missouri, to North Kansas City and Clay County, the Chouteau Bridge was built in 1886-87 for the Chicago, Milwaukee and St. Paul Railroad. It spans the Missouri River in a north/south direction, four miles downstream from the confluence of the Kansas and Missouri Rivers. In order to provide funds for the new line, the CM&StP issued income bonds totalling \$5,000,000.00. The sale of these bonds, in addition to the existing Chicago and Pacific Western Division bonds, made the Missouri connection a reality. In March 1886, after the right-of-way for this new line was obtained and funding was procured, a contract with the Herman Clark and Company of New York to extend the railroad was approved. Concurrent with this transaction, contracts were let to the Keystone Bridge Works of Pittsburgh for the bridge's superstructure and with Sooy Smith Company of New York for the construction of the bridge's abutments and piers. Charles Louis Strobel, consulting engineer and agent for the Keystone Bridge Works' Chicago office, was chosen as designer for the bridge.

While grading of the railroad line commenced in the spring of 1886, actual construction of the span did not commence until the fall of that year. Work on the massive stone substructure--and later the wrought iron trusses--continued for six months past the July 1887 contract deadline. Finally, on 5 December 1887, the CM&StP opened its new Chicago-Kansas City line. Although the bridge was modified for vehicular traffic in the early 1950s, the structure essentially appears as it was originally constructed. The superstructure features three Whipple truss spans that stretch over the Missouri River. With the design of the Milwaukee Road, Strobel introduced the "A-Iron column." These columns can be found at the trestle-bents where Strobel found that "important advantages could be secured for this part of the

structure by adopting for the compression members a new form of cross-section consisting of four Z-Irons joined by lattice bars in the middle plane." Through the years, there have been several alterations made to the bridge, but the most significant change occurred in 1951-1953 when the bridge was sold to Kansas City and converted to two-lane highway use. As a result of the conversion, the original deck of the bridge was removed and replaced with an open grating and concrete deck. New guardrails were also installed. In addition to these modifications, the name of the bridge was changed to The Francois Chouteau Bridge, in commemoration of the first family of Kansas City, Missouri. On 17 September 1953, the Chouteau Bridge officially opened to highway traffic. The bridge has functioned in place since then, although its demolition is currently being discussed.

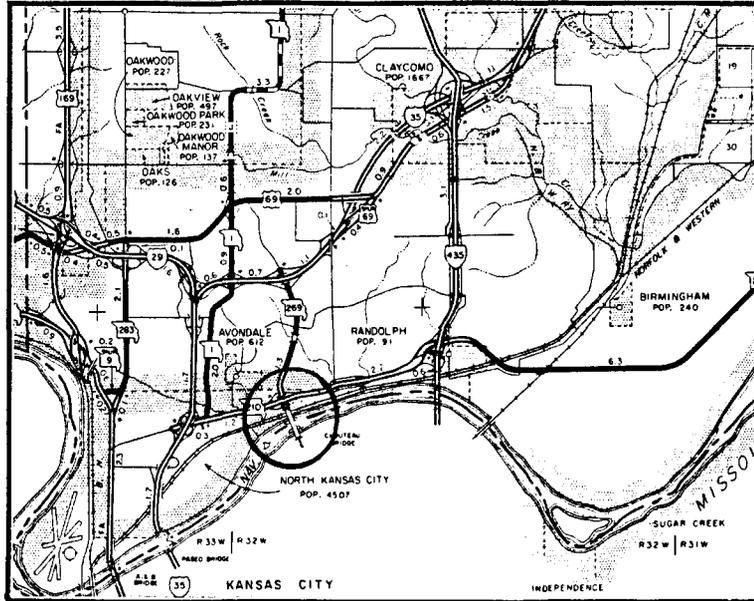

The Chouteau Bridge is the oldest of the fourteen vehicular steel truss bridges spanning the Missouri River that are included in the statewide bridge inventory. As a group, these spans comprise some of the state's longest vehicular crossings. The Chouteau Bridge is historically significant because of its early erection date, and because it served as a strategic railroad crossing into Kansas City for more than fifty years. A pivotal transportation link, the bridge helped open up new areas to settlement, and had a major impact on Kansas City's socioeconomic development.

The Chouteau Bridge is technologically significant because it ranks among the state's longer examples of iron or steel truss construction. With an overall length of 1,359 feet, the multiple-span structure is a superlative example of its type. The structure is also significant because of its Whipple truss design. The Whipple truss differed from the more common Pratt truss in that its diagonal members extended across, not one, but rather two panels. This variation provided greater lateral support for the diagonals, a critical consideration on deep, long-span trusses. Accordingly, most of the railroad bridges built across the Missouri in the 1880s utilized the Whipple design. Few of these structures remain, however, and the Chouteau Bridge is the state's only Missouri River railroad Whipple truss known to have been converted to vehicular use. Having made a significant contribution to Kansas City's historical development, and as a superlative example of a rare bridge type, the Chouteau Bridge is clearly eligible for inclusion in the National Register of Historic Places under both Criteria A and C.

superstructure: concrete deck girder with arched haunches
substructure: concrete abutments; stone and concrete wingwalls
floor/decking: concrete deck
other features: slotted concrete guardrails

This small-scale concrete bridge carries Wildwood Avenue over Henrie Street in the small town of Excelsior Springs. The Wildwood Avenue Overpass consists of a single concrete deck girder span, with four concrete beams that have arched haunches, supported by concrete abutments. Sidewalks on either side of the roadway are supported by cantilevered brackets; these are bounded by slotted concrete guardrails. These guardrails provide the only architectural embellishment for the bridge. They also represent its most serious alteration, for the sidewalks, cantilever brackets and guardrails have all been added to the original structure. Structure Inventory and Appraisal records indicate that the Wildwood Avenue Overpass was built in 1907, although no county records have been found to corroborate this date. The bridge is today distinguished as the oldest remaining concrete girder span in Missouri. Its lack of documentation and subsequent alterations diminish its interpretive value, however.

Located in northern Clay County, this bridge carries County Road 49 over New Hope Creek some three miles northeast of Kearney. The structure is comprised of two filled spandrel concrete arches, with concrete substructure and a deck that cantilevers over the arches' spandrel walls on concrete brackets. The arch features the distinctive horseshoe profile, indicating its design source as the patent held by Indianapolis engineer Daniel B. Luten. The New Hope Creek Bridge is one of several Clay County concrete arches built around 1920. In April 1919 the county court directed the county surveyor to prepare plans for a "bridge on the north line in Section 14, T53N, R31W." The county later solicited for competitive bids for the bridge's construction. Two bids were submitted, one by the Topeka Bridge and Iron Company of Kansas, for \$5965.00, and a second, higher bid by the Kansas City Bridge Company. The Topeka bid was accepted; construction was completed later that same year. The New Hope Creek has carried vehicular traffic since, with no significant alterations.

Daniel Luten patented his namesake concrete arch in 1905. Soon thereafter, he began marketing it on a national basis through his own construction company, and through regional representatives. The Topeka Bridge and Construction Company functioned as Luten's western representative, building Luten arches and other concrete bridges in the Midwest, the mountain states and as far away as Arizona. Although these bridges were marketed extensively and Luten protected his broadly defined patent rights aggressively through the courts, his arch designs never found universal acceptance. Relatively few Luten arches have been identified by the Missouri statewide bridge inventory. The New Hope Creek Bridge in Clay County is distinguished among these for its relatively early construction date and its high degree of physical integrity. Designed and built by one of Daniel Luten's major subsidiaries, it is a well-preserved, small-scale representative of early patented concrete bridge design.

span number:	1	superstructure:	concrete filled spandrel arch
span length:	42.0'	substructure:	concrete abutments and wingwalls
total length:	45.0'	floor/decking:	earth fill over concrete
roadway wdt.:	18.0'	other features:	concrete guardrails with recessed rectangular panels

This small-scale concrete arch bridge carries a gravel-surfaced county road over a branch of Carroll Creek northeast of Kearney. The structure consists of a single filled spandrel arch on concrete abutments, featuring plainly detailed concrete guardrails with recessed rectangular panels. The Carroll Creek Bridge dates to 1920. In April of that year the Clay County Court directed the county surveyor to prepare a cost estimate and specifications for this bridge, one over Shoal Creek [CLAY03] and three other spans. The county solicited competitive bids for the bridges, and in June proposals were received from five bridge companies: the Topeka Bridge and Construction Company, the Kansas City Bridge Company, Walter Archer, C.G. Hamilton, and the Phillips Contracting Company. Low bidder at \$6980.00, Phillips received the contract to build the Shoal Creek Bridge. The Buckner, Missouri, contractor reportedly completed the bridge in 1921. Since that time it has functioned in place, with no major alterations.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. Of the more than 13,000 pre-1951 bridges identified in Missouri by the statewide historic bridge inventory, only about 85 are filled spandrel concrete arches. These break down into roughly three equal groups: arches built to carry urban streets, those built by the state highway department in the 1920s and 1930s to carry highways and those built by the counties at rural county road crossings. The Carroll Creek Bridge falls into the third category. With its 55-foot span and 1920-21 construction date, it is among the longer and older of these rural county arches. The Carroll Creek Bridge does not display any features that could be regarded as technologically superlative. Rather, the bridge derives its significance from its representation of the broad trend of concrete bridge construction in Missouri. As a well-preserved and well-documented early concrete arch—designed by a county engineer as the state highway department was just beginning to draft standardized plans—the Carroll Creek Bridge is an important transportation-related resource.

superstructure: concrete open spandrel arch
substructure: concrete abutments and wingwalls
floor/decking: concrete deck
other features: slotted concrete guardrails; builder's plate: WESTERN BRIDGE CO. / HARRISONVILLE MO / 1917 / W.C. PATTON / CITY ENGINEER

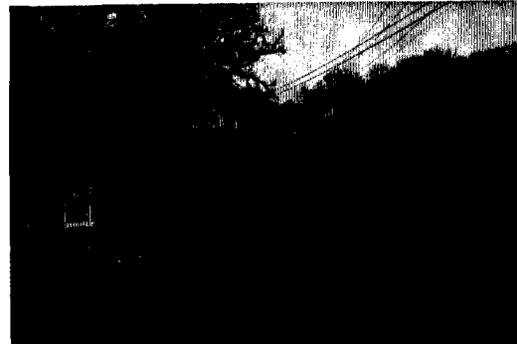

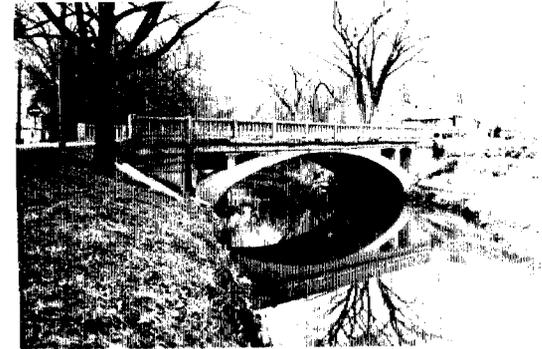

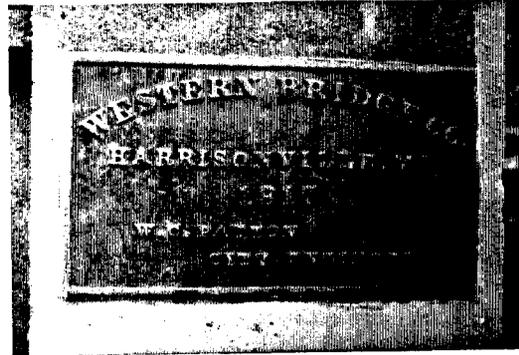

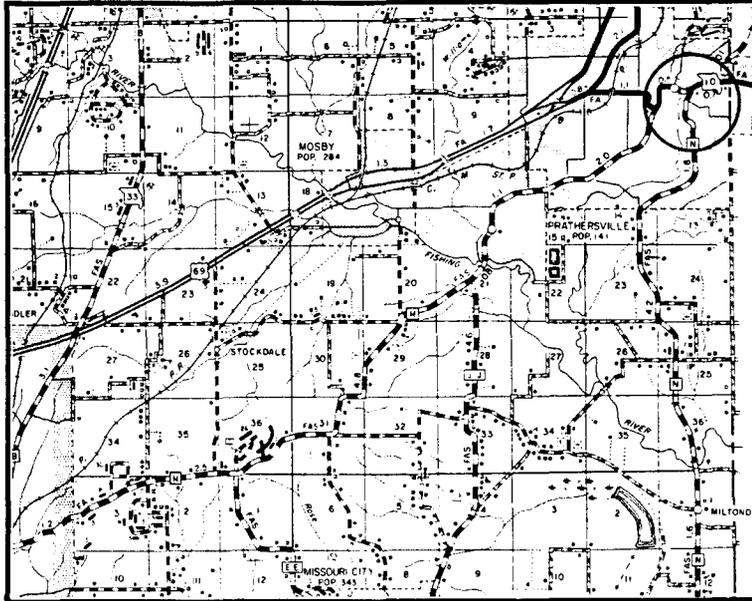

This small-scale concrete bridge carries Garland Street over the Dry Fork of Fishing River in Excelsior Springs. Comprised of an open spandrel concrete arch, the bridge features slotted concrete guardrails as its only architectural detailing. The Garland Street Bridge was designed by city engineer W.C. Patton, who, judging from the distinctive arch profile, may have had assistance from a representative of the Topeka Bridge and Iron Company, then active in the county. The city contracted with the Western Bridge Company of Harrisonville, Missouri, to construct the arch. Completed in 1917, the Garland Street Bridge has functioned in place since, with no serious alterations. It is today noteworthy as an early example of pre-MSHD concrete bridge construction.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. Of the more than 13,000 pre-1951 bridges identified in Missouri by the statewide historic bridge inventory, only about three dozen are open spandrel concrete arches. The Garland Street Bridge is distinguished among these for its relatively early construction and its well-preserved condition.

total length: 104.0'	floor/decking: cantilevered concrete
roadway wdt.: 19.0'	other features: limestone, ashlar rubble facing; 5-panel classical balustrade guardrails

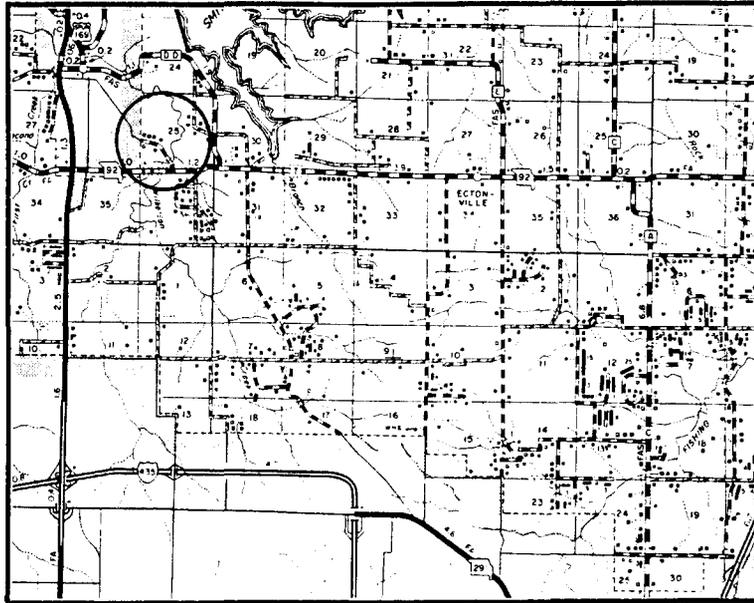

Located southeast of Smithville, this bridge carries County Road 153 over Wilkerson Creek. The structure is comprised of a single filled spandrel concrete arch, with concrete substructure and a deck that cantilevers over the arches' spandrel walls on concrete brackets. The arch features the distinctive horseshoe profile, indicating its design source as the patent held by Indianapolis engineer Daniel B. Luten. The Wilkerson Creek Bridge is one of several Clay County concrete arches built around 1920. In August 1921 the Clay County surveyor provided cost estimates for twenty bridges and culverts of varying sizes to the county court. Later that summer bids for their construction were received from eight bridge contractors: the Kansas City Bridge Company, Buis & Olson, Louis Carr, Walter Archer, Weldin & Kimsey, John Brockman, J. Walter Phillips and the Topeka Bridge and Construction Company. The only contractor from out-of-state, Topeka was the low bidder at \$10,904.00 for the Wilkerson Creek structure. The contractor commenced work soon thereafter, presumably finishing the bridge later that year. Since its completion, the Wilkerson Creek Bridge has carried vehicular traffic in essentially unaltered condition.

Daniel Luten patented his namesake concrete arch in 1905. Soon thereafter, he began marketing it on a national basis through his own construction company, and through regional representatives. The Topeka Bridge and Construction Company functioned as Luten's western representative, building Luten arches and other concrete bridges in the Midwest, the mountain states and as far away as Arizona. Although these bridges were marketed extensively and Luten protected his broadly defined patent rights aggressively through the courts, his arch designs never found universal acceptance. Relatively few Luten arches have been identified by the Missouri statewide bridge inventory. The Wilkerson Creek Bridge in Clay County is distinguished among these for its high degree of physical integrity. Designed and built by one of Daniel Luten's major subsidiaries, it is a well-preserved, small-scale representative of early patented concrete bridge design.

OWNER

Clay County

span number: 2
span length: 48.0'
total length: 119.0'
roadway wdt.: 18.1'

superstructure: concrete Luten arch
substructure: concrete abutments, wingwalls and pier
floor/decking: earth over concrete fill
other features: bullnosed cutwaters in pier; concrete guardrails with classical cast balusters

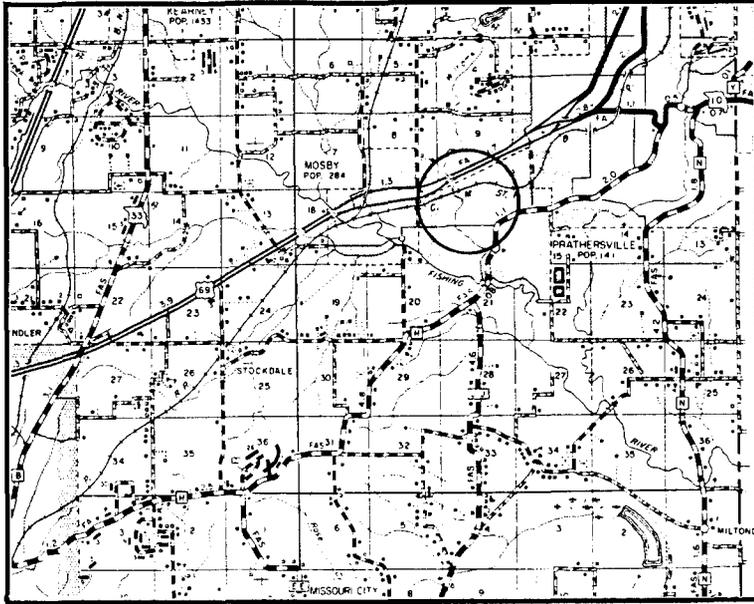

The Williams Creek Bridge in Mosby spans Williams Creek in east-central Clay County. This two-span concrete filled spandrel arch features concrete abutments and wingwalls, with a classical concrete balustrade and bullnosed cutwaters on the center pier. The Williams Creek Bridge dates to 1919. In August of that year the county clerk noted that the "court agrees with the commissioners of Excelsior Springs to pay \$4500.00 towards the cost of two bridges", including this structure over Williams Creek. Two months later the court awarded a contract to build the Williams Creek Bridge to the Topeka Bridge and Iron Company for \$11,700.00. In July 1920 the court paid \$5850.00 toward the bridge's construction, indicating the structure's completion. Since that time the Williams Creek Bridge has functioned in place, with the removal of a portion of its guardrail as the only serious addition.

The Williams Creek Bridge employs a patented arch type that had been developed by Indianapolis engineer Daniel B. Luten in 1905. Luten marketed his arch on a national basis through his own construction company, and through regional representatives. The Topeka Bridge and Construction Company functioned as Luten's western representative, building Luten arches and other concrete bridges in the Midwest, the mountain states and as far away as Arizona. Although these bridges were marketed extensively and Luten protected his broadly defined patent rights aggressively through the courts, his arch designs never found universal acceptance. Relatively few Luten arches have been identified by the Missouri statewide bridge inventory. The Williams Creek Bridge in Clay County is a representative example of this early patented concrete bridge design.

GENERAL DATA

structure no.:	205000.5	city/town:	4.1 miles south of Calhoun
county:	Henry	feature inters.:	branch of Tebo Creek
		cadastral grid:	S24, T42N, R25W
		highway route:	County Road 205
		highway distr.:	4
		current owner:	Henry County

STRUCTURAL DATA

superstructure:	steel, 5-panel, pin-connected Pratt pony truss		
substructure:	unknown		
span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	80.0'	floor/decking :	timber deck
roadway width:	13.8'	other features:	no guardrails

HISTORICAL DATA

erection date:	c1910
erection cost:	unknown
designer:	Canton Bridge Company, Canton OH (probable)
fabricator :	Canton Bridge Company, Canton OH (probable)
contractor :	county work force (probable)

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 205000.5; Henry County Court Record, Book U: page 176 (3 March 1913) - located at the Henry County Courthouse, Clinton MO.

sign. rating:	36
evaluation:	NRHP non-eligible (slightly longer than average, but typically configured example of a common structural type)

inventoried by: Clayton B. Fraser 20 April 1994

Fields Creek Bridge

HENR11

GENERAL DATA

structure no.:	239000.6	city/town:	3.9 miles northwest of Clinton
county:	Henry	feature inters.:	Fields Creek
		cadastral grid:	S31, T42N, R26W
		highway route:	County Road 239
		highway distr.:	4
		current owner:	Henry County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt half-hip pony truss
substructure: concrete abutments and wingwalls

span number:	1	condition:	fair
span length:	68.0'	alterations:	none
total length:	69.0'	floor/decking :	timber deck over steel stringers
roadway width:	11.8'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: 4 angles with lacing; diagonal: 2 punched rectangular eyebars; counter: looped round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; guardrail: 2 angles; builder's plate: The Canton Bridge Co. Canton Ohio

HISTORICAL DATA

erection date: c1915
erection cost: unknown
designer: Canton Bridge Company, Canton OH
fabricator : Canton Bridge Company, Canton OH;
Cambria Steel Company, Pittsburgh PA
contractor: county work force (probable)
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 239000.6; field inspection by Mark Hufstetler, 10 February 1991.
sign. rating: 36
evaluation: NRHP non-eligible (typically configured, relatively late example of common structural type)

inventoried by: Clayton B. Fraser 20 April 1994

Deer Creek Bridge

HENR14

GENERAL DATA

structure no.: 329001.0	city/town: 1.9 miles southeast of Clinton
county: Henry	feature inters.: Deer Creek
	cadastral grid: S12, T41N, R26W
	highway route: County Road 329
	highway distr.: 4
	current owner: Henry County

STRUCTURAL DATA

superstructure: steel, 5-panel, rigid-connected, 2-angle Camelback pony truss	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 80.0'	alterations: none
total length: 80.0'	floor/decking : concrete deck over steel stringers
roadway width: 14.5'	other features: upper chord and inclined end post: 2 angles; lower chord: 2 angles; vertical: 2 angles; diagonal: 1 or 2 angles; lateral bracing: round rod with threaded ends; guardrail: 2 angles

HISTORICAL DATA

erection date: c1925	
erection cost: unknown	
designer: unknown	
fabricator : unknown	
contractor: county work force (probable)	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 329001.0; field inspection by Mark Hufstetler, 10 February 1991.	
sign. rating: 48	
evaluation: NRHP non-eligible (relatively uncommon structural type, but lacking in documentation)	

inventoried by: Clayton B. Fraser 20 April 1994

Deepwater Creek Bridge

HENR15

GENERAL DATA

structure no.: 338000.9	city/town: 3.2 miles northwest of Deepwater
county: Henry	feature inters.: Deepwater Creek
	cadastral grid: S5, T40N, R26W
	highway route: County Road 338
	highway distr.: 4
	current owner: Henry County

STRUCTURAL DATA

superstructure: steel, 5-panel, pin-connected Pratt pony truss	
substructure: stone masonry abutments and pier	
span number: 1	condition: fair
span length: 70.0'	alterations: unknown
total length: 112.0'	floor/decking : timber deck
roadway width: 13.8'	other features: steel angle guardrails

HISTORICAL DATA

erection date: c1900
erection cost: unknown
designer: unknown
fabricator : unknown
contractor : unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 338000.9.

sign. rating: 29
evaluation: NRHP non-eligible (typically configured example of common structural design, distinguished somewhat by its stone abutments)

inventoried by: Clayton B. Fraser 20 April 1994

Deepwater Creek Bridge

HENR18

GENERAL DATA

structure no.: 490001.8	city/town: 5.9 miles northwest of Deepwater
county: Henry	feature inters.: branch of Deepwater Creek
	cadastral grid: S2, T40N, R27W
	highway route: County Road 490
	highway distr.: 4
	current owner: Henry County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt pony truss	
substructure: timber pile bent abutments and wingwalls	
span number: 1	condition: fair
span length: 60.0'	alterations: unknown
total length: 62.0'	floor/decking : timber deck
roadway width: 13.8'	other features: steel angle guardrails

HISTORICAL DATA

erection date: c1910	
erection cost: unknown	
designer: Canton Bridge Company, Canton OH (probable)	
fabricator : Canton Bridge Company, Canton OH (probable)	
contractor : county work force (probable)

1917

LOCATION

County Road 193 over West Fork of Tebo Creek; S10/15, T42N, R25W
3.4 miles southwest of Calhoun; Henry County, Missouri

USE (ORIGINAL / CURRENT)

roadway bridge / roadway bridge

RATING NRHP possibly eligible (score: 54)

CONDITION

good

OWNER

Henry County

span number: 3
span length: 32.0'
total length: 65.0'
roadway wdt.: 13.2'

superstructure: concrete, 2-rib, deck girder with arched haunches, skewed
substructure: concrete abutments, wingwalls and piers
floor/decking: concrete deck
other features: concrete guardrails with incised panels and open balustrade; **"NEWMAN BRIDGE 1917"**
incised in center of balustrade at north end

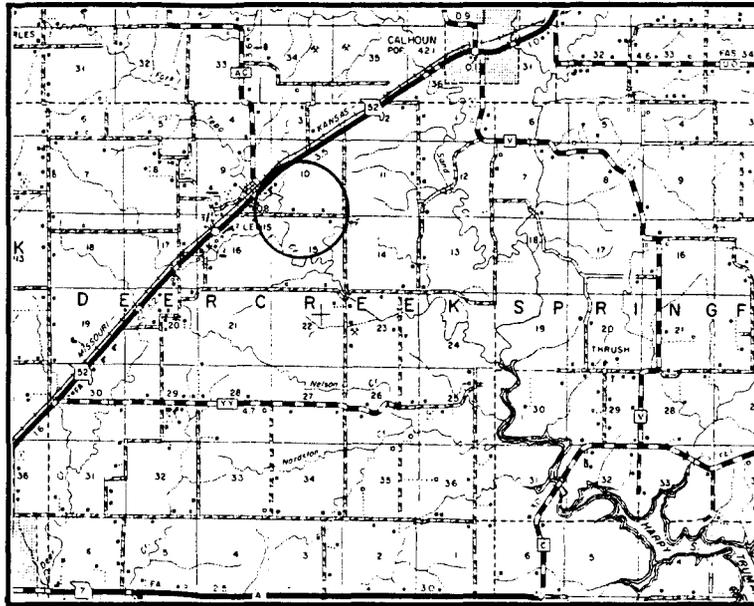

Around the turn of the century, the Henry County Court began contracting with the Canton Bridge Company of Canton, Ohio, for its major and minor roadway bridges. Marketed to the county by Canton's Kansas City sales representative, J.W. Hoover, the giant bridge firm fabricated and shipped a variety of steel trusses, which were erected over creeks using local labor. The county and the bridge company maintained an almost exclusive relationship over the next two decades. After about 1910, the county began using concrete for bridge decks and substructures but still relied on steel trusses for virtually all of its spans over 40 feet. This changed in 1917. That year Henry County solicited competitive bids for two rural bridges over Tebo Creek—one immediately east of Lewis, the other about a mile downstream. In September proposals were received from Canton and from local builder R.T. Faith. Faith was awarded the contract to build a steel truss at the ;lower crossing for \$1850.00. Canton's bid to erect a standard steel truss at the upper crossing was \$2100.00, \$50 less than Faith's. As an alternative, the bridge company proposed to build a concrete girder structure here for \$1985.00. "The Court further finds that said bridge Canton Bridge Company guarantees its said concrete bridge to be erected near Lewis, Missouri, for a period of four years," the county clerk stated, "and the said bid of the Canton Bridge Company on the Concrete bridge... is the best bid presented." Canton's proposed structure consisted of three spans, the longest of which extended 32 feet. Each span was comprised of two spandrel girders with arched haunches, supported on a slight skew by concrete piers and abutments. The variable depth configuration of the girders suggested cantilevered construction, but they may have been arched for aesthetic reasons. Canton received the contract for the concrete structure and began work soon thereafter. The Newman Bridge, as the span was known locally, was completed later in 1917. It has functioned in place since, with only minor collision damage to its concrete guardrails as the only change.

Missouri was slow to embrace concrete as a bridge superstructural material after the turn of the century. It was not until the state highway department began promulgating standard concrete slab and girder designs in the 1920s that the counties began building all-concrete bridges with any regularity. Concrete bridges built before 1922 are a relative rarity in the state for this reason. The Newman Bridge in Henry County is noteworthy as an early and, with its arched girders, well-articulated example of concrete bridge construction. The first such concrete structure built by the county, it represented a locally significant watershed in local bridge construction.

Little Blue River Bridge

JACK01

GENERAL DATA

structure no.:	G 363R1	city/town:	Kansas City
county:	Jackson	feature inters.:	Little Blue River
		cadastral grid:	S19, T49N, R31W
		highway route:	U.S. Highway 40
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel, 5-panel, rigid-connected Pratt through truss, with rigid-connected Pratt pony truss approach spans		
substructure:	concrete abutments, wingwalls and piers		
span number:	1; 2	condition:	good
span length:	100.0'; 50.0'	alterations:	deck widened and guardrails replaced, 1975
total length:	207.0'	floor/decking :	concrete deck over steel stringers
roadway width:	20.5'	other features:	Armco guardrails

HISTORICAL DATA

erection date:	1923
erection cost:	\$26,009.00
designer:	Missouri State Highway Department
fabricator :	unknown
contractor:	W.A. Ross Company, Kansas City MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number G 363R1; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO.
sign. rating:	34
evaluation:	NRHP non-eligible (typical detailing and configuration for this structural type)

inventoried by: Clayton B. Fraser 20 September 1994

Blue River Bridge

JACK03

GENERAL DATA

structure no.:	J 526	city/town:	Kansas City
county:	Jackson	feature inters.:	Blue River
		cadastral grid:	S13, T49N, R33W
		highway route:	U.S. Highway 40
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, rigid-connected tied arch, with steel stringer approach spans
substructure: concrete abutments, wingwalls and spill-through piers

span number:	1	condition:	good
span length:	140.0'	alterations:	none
total length:	430.0'	floor/decking :	concrete deck over steel stringers
roadway width:	40.0'	other features:	arch rib: two built-up channels with slotted cover plates; lower chord: two built-up channels with batten plates; vertical: I-beam; strut: variable-depth plate girder; upper later bracing: plate girder; floor beam: I-beam; sidewalks with lattice guardrails cantilevered from both sides

HISTORICAL DATA

erection date: 1933-34
erection cost: \$118,492.00
designer: Missouri State Highway Department
fabricator : unknown
contractor: Davis Construction Company, Gerard Knutson and Lam Construction Company

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number J 526; Primary System Bridge Record, located at Missouri Highway and Transportation Department, Jefferson City, Missouri; **Ninth Biennial Report of the State Highway Commission of Missouri**, 1933-34, pp. 189-190.

sign. rating: 73
evaluation: NRHP eligible (unique example in Missouri of uncommon structural type, in well-preserved condition)

inventoried by: Clayton B. Fraser 24 September 1994

A.S.B. Bridge

JACK05

GENERAL DATA

structure no.:	K 229R4	city/town:	Kansas City
county:	Jackson	feature inters.:	Missouri River
		cadastral grid:	S32, T50N, R33W
		highway route:	U.S. Highway 71
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, 16-panel, rigid-connected, double-deck Baltimore vertical lift truss, with two fixed-span Baltimore double-deck trusses and steel deck girder approach spans

substructure: concrete/stone abutments and piers

span number:	3	condition:	good
span length:	428.0'	alterations:	reflooring, reconditioning 1927; span replaced, 1932; upper deck and approaches removed, 1987
total length:	1467.0'	floor/decking :	lower deck: railroad rail deck over steel plate girders; upper deck: removed
roadway width:	51.0'	other features:	upper chord and inclined end post: 2 built-up channels with lacing; lower chord: 2 built-up channels with lacing; vertical: 2 channels with lacing; diagonal: 2 channels or 2 angles with lacing; floor beam: riveted plate girder; steel guardrails

HISTORICAL DATA

erection date: 1889-90; 1909-11

erection cost: \$2,534,829.23

designer: J.A.L. Waddell, Kansas City MO

fabricator : unknown

contractor: McClintic-Marshall Construction Company, Pittsburgh PA (superstructure); James O'Connor & Son, Kansas City MO (substructure reconstruction); American Electric Company, St. Joseph MO (electrical equipment)

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 229R4; *Kansas City Times*, 29 December 1911, 10 February 1911, 2 May 1927; Bob Hayden, "The A.S.B. Bridge: Grand Old Lady of the Missouri," *Kansas City Star Magazine*, 28 November 1976; Engineers Club of Kansas City, *Inspection of the Fratt Bridge over the Missouri River at Kansas City, Mo.*, program for luncheon held 18 November 1911; Donald Hoffman, "Missouri River Workhorses," *Kansas City Star*, 29 July 1980; Donald C. Waddell, **Bridge Engineering** (New York: John Wiley and Sons, 1916), pages 723-728; field inspection by Clayton Fraser, October 1994.

sign. rating: 82

evaluation: NRHP eligible (nationally significant example of uncommon structural type)

inventoried by: Clayton B. Fraser 20 September 1994

Winner Road Bridge

JACK06

GENERAL DATA

structure no.:	K 392R	city/town:	Kansas City
county:	Jackson	feature inters.:	Big Blue River
		cadastral grid:	S1/36, T49N/T50N, R32W
		highway route:	U.S. Highway 24
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel rigid frame	condition:	good
substructure:	steel rigid-frame legs on concrete pedestals	alterations:	cantilevered sidewalks added, 1977
span number:	1; 2	floor/decking :	concrete deck over steel stringers
span length:	130.0'; 95.0'	other features:	concrete guardrails; sidewalks cantilevered from bridge spandrels, with chain link fencing
total length:	366.0'		
roadway width:	42.0'		

HISTORICAL DATA

erection date:	1934-35
erection cost:	\$51,739.00 (substructure); \$68,415.95 (superstructure)
designer:	Missouri State Highway Department
fabricator :	unknown
contractor:	M.E. Gillioz, Monett MO
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 392R; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; "Conquering the Wilderness of the Blue Valley with Viaducts and Trafficways," <i>Kansas City Star</i> , 20 September 1935; <i>The History of Missouri</i> , Vol. 3 (New York: Lewis Historical Publishing Company, 1967), 451-52; State Highway Commission, <i>Ninth Biennial Report</i> , 1933-34, pages 183-191; "Winner Road Viaducts," <i>Kansas City Star</i> , 4 August 1935.
sign. rating:	69
evaluation:	NRHP possibly eligible (rare example of MSHD experimental structural type)

inventoried by: Clayton B. Fraser 20 September 1994

Winner Road Viaduct

JACK07

GENERAL DATA

structure no.: K 393R	city/town: Kansas City
county: Jackson	feature inters.: Kansas City Southern Railroad
	cadastral grid: S1/36, T50N, R32W
	highway route: U.S. Highway 24
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel rigid frame	
substructure: steel rigid-frame legs on concrete pedestals	
span number: 6; 2	condition: good
span length: 46.0'; 34.0'	alterations: cantilevered sidewalks added, 1977
total length: 343.0'	floor/decking : concrete deck over steel stringers
roadway width: 42.0'	other features: concrete guardrails; sidewalks cantilevered from bridge spandrels, with chain link fencing

HISTORICAL DATA

erection date: 1934-35	
erection cost: \$26,481.25 (substructure); \$54,947.50 (superstructure)	
designer: Missouri State Highway Department	
fabricator : unknown	
contractor: M.E. Gillioz, Monett MO	
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 393R; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; State Highway Commission, Ninth Biennial Report , 1933-34, pages 183-191; "Winner Road Viaducts," <i>Kansas City Star</i> , 4 August 1935.
sign. rating: 61	
evaluation:	NRHP possibly eligible (rare example of MSHD experimental structural type)

inventoried by: Clayton B. Fraser 20 September 1994

Winner Road Viaduct

JACK08

GENERAL DATA

structure no.:	K 394R	city/town:	Kansas City
county:	Jackson	feature inters.:	St. Louis & San Francisco Railroad
		cadastral grid:	S1/36, T49/50N, R33W
		highway route:	U.S. Highway 24
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel rigid frame	condition:	good
substructure:	steel rigid-frame legs on concrete pedestals	alterations:	cantilevered sidewalks added, 1977
span number:	17.0	floor/decking :	concrete deck over steel stringers
span length:	76.0'	other features:	concrete guardrails; sidewalks cantilevered from bridge spandrels, with chain link fencing
total length:	1243.0'		
roadway width:	42.0'		

HISTORICAL DATA

erection date:	1934-35
erection cost:	\$80,657.00 (substructure); \$170,155.85 (superstructure)
designer:	Missouri State Highway Department
fabricator :	unknown
contractor :	M.E.Gillioz, Monett MO
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 394R; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; State Highway Commission, Ninth Biennial Report , 1933-34, pages 183-191; "Winner Road Viaducts," Kansas City Star , 4 August 1935.
sign. rating:	66
evaluation:	NRHP possibly eligible (rare example of MSHD experimental structural type)

inventoried by: Clayton B. Fraser 20 September 1994

Intercity Viaduct

JACK09

GENERAL DATA

structure no.:	K 608R	city/town:	Kansas City
county:	Jackson	feature inters.:	Kaw River and city streets
		cadastral grid:	S6, T49N, R33W
		highway route:	U.S. Highway 40
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel, rigid-connected Warren deck truss, with plate deck girder rigid-frame approach spans		
substructure:	concrete abutments, wingwalls and steel legs on concrete pedestals		
span number:	1	condition:	good
span length:	147.0'	alterations:	roadway widened and guardrails replaced
total length:	4,230.0'	floor/decking :	concrete deck over steel stringers
roadway width:	52.0'	other features:	concrete guardrails with pipe over

HISTORICAL DATA

erection date:	1936
erection cost:	\$690,963.00
designer:	Missouri State Highway Department
fabricator :	unknown
contractor:	M.E. Gillioz, Monett MO
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 608R; Tenth Biennial Report of the State Highway Commission of Missouri , 1935-36, pp. 262-264; Kansas City Public Service Company, History of Bridges and Viaducts , page 25.
sign. rating:	63
evaluation:	NRHP possibly eligible (important urban viaduct, substantially altered)

inventoried by: Clayton B. Fraser 20 September 1994

Rock Creek Bridge

JACK10

GENERAL DATA

structure no.: K 653R1	city/town: Kansas City
county: Jackson	feature inters.: Rock Creek
	cadastral grid: S32, T50N, R32W
	highway route: U.S. Highway 24 (Winner Road)
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: concrete deck girder	
substructure: concrete abutments and wingwalls with concrete column piers	
span number: 1; 2	condition: good
span length: 60.5'; 24.0'	alterations: bridge widened at least twice
total length: 110.0'	floor/decking : concrete deck
roadway width: 77.3'	other features: MSHD standard concrete guardrails; curved girder haunches

HISTORICAL DATA

erection date: 1911	
erection cost: unknown	
designer: Metropolitan Street Railway Company (probable)	
fabricator : none	
contractor: Metropolitan Street Railway Company (probable)	
references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number K 653R1; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; Kansas City Public Service Company, History of Bridges and Viaducts , page 20-J - located at Kansas City Engineer's Office, Kansas City, Missouri.	
sign. rating: 39	
evaluation: NRHP non-eligible (early example of concrete urban bridge construction)	

inventoried by: Clayton B. Fraser 21 September 1994

Ramp F Overpass

JACK11

GENERAL DATA

structure no.:	L 249	city/town:	Kansas City
county:	Jackson	feature inters.:	Ramp D
		cadastral grid:	
		highway route:	Ramp F
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	concrete rigid frame		
substructure:	concrete abutments and stone wingwalls		
span number:	1	condition:	good
span length:	53.0'	alterations:	none
total length:	59.0'	floor/decking :	concrete deck
roadway width:	24.0'	other features:	stone parapets

HISTORICAL DATA

erection date:	1949
erection cost:	\$112,624.39
designer:	Missouri State Highway Department
fabricator :	none
contractor:	Swenson Construction Company
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number L 249; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; Elmer Napier, "Rigid-Frame Bridges," Roads and Bridges , April 1940, page 13; field inspection by Clayton Fraser, October 1994.
sign. rating:	51
evaluation:	NRHP possibly eligible (well-preserved example of uncommon structural type)

Inventoried by: Clayton B. Fraser 21 September 1994

Broadway Overpass

JACK12

GENERAL DATA

structure no.: L 253	city/town: Kansas City
county: Jackson	feature inters.: 30th Street
	cadastral grid: S17, T49N, R33W
	highway route: Broadway Street
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: concrete rigid frame	
substructure: concrete abutments and stone wingwalls	
span number: 1	condition: good
span length: 50.0'	alterations: none
total length: 58.0'	floor/decking : concrete deck
roadway width: 56.0'	other features: stone parapets

HISTORICAL DATA

erection date: 1949-50
erection cost: \$112,241.39
designer: Missouri State Highway Department
fabricator : none
contractor: Bushman Construction Company

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number L 253; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; Elmer Napier, "Rigid-Frame Bridges," **Roads and Bridges**, April 1940, page 13; field inspection by Clayton Fraser, October 1994.

sign. rating: 51
evaluation: NRHP possibly eligible (well-preserved example of uncommon structural type)

inventoried by: Clayton B. Fraser 21 September 1994

Liberty Bend Bridge

JACK13

GENERAL DATA

structure no.: L 568R1 city/town: 4.5 miles northeast of Independence
county: Jackson / Clay feature inters.: Missouri River
cadastral grid: S5, T50N, R32W
highway route: State Highway 291
highway distr.: 4
current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, 2-span, rigid-connected cantilever through truss; cantilevered Warren deck truss approach spans; steel deck girder approach spans

substructure: concrete abutments and spill-through piers

span number: 2 condition: good
span length: 460.0' alterations: deck replaced with steel grid, 1984; part of grid deck replaced, 1986
total length: 1,884.0'
roadway width: 24.0' floor/decking: concrete deck over steel stringers
other features: upper chord and inclined end post: 2 built-up channels with cover and batten plates; lower chord: 2 built-up channels with lacing; vertical: 2 channels with lacing; diagonal: 2 channels with lacing or batten plates; lateral bracing: 2 angles; floor beam: I-beam, field-bolted to vertical; strut: 2 angles with lacing; steel guardrails

HISTORICAL DATA

erection date: 1947
erection cost: unknown
designer: Sverdrup and Parcel, St. Louis MO (probable)
fabricator: Carnegie Steel Company, Pittsburgh PA
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number L 568R1; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; State Highway Commission, **Thirteenth Biennial Report**, 1941-42, page 149; field inspection by Lon Johnson, 3 February 1991.

sign. rating: 52
evaluation: NRHP possibly eligible (well-preserved example of large-scale truss bridge construction on a crossing of the Missouri River)

inventoried by: Clayton B. Fraser 21 September 1994

Sni-A-Bar Creek Bridge

JACK14

GENERAL DATA

structure no.: Y 24	city/town: 2.1 miles northeast of Lone Jack
county: Jackson	feature inters.: Phillips Creek
	cadastral grid: S4/5, T47N, R29W
	highway route: State Supplementary Route F
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: concrete filled spandrel arch	
substructure: concrete abutments and wingwalls	
span number: 1	condition: good
span length: 45.0'	alterations: Armco guardrails added
total length: 70.0'	floor/decking : concrete/asphalt over concrete
roadway width: 40.0'	other features: paneled concrete guardrails

HISTORICAL DATA

erection date: 1911-12	
erection cost: \$6945.00 (contract amount)	
designer: unknown	
fabricator : none	
contractor: Illinois Steel Bridge Company, Jacksonville IL	
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number Y 24; Jackson County Court Record, Book 47, page 412 (22 August 1911), page 454 (18 September 1911); Book 48, page 34 (16 January 1912) - located at Jackson County Courthouse, Independence, Missouri; field inspection by Lon Johnson, 6 February 1991.
sign. rating: 50	
evaluation:	NRHP possibly eligible (early, well-preserved example of concrete bridge construction)

inventoried by: Clayton B. Fraser 21 September 1994

Sni-A-Bar Creek Bridge

JACK15

GENERAL DATA

structure no.: Y 148	city/town: 1.2 miles north of Oak Grove
county: Jackson	feature inters.: Sni-A-Bar Creek
	cadastral grid: S20/21, T49N, R29W
	highway route: State Supplementary Route H
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, 7-panel, rigid-connected Pratt through truss	
substructure: concrete abutments and wingwalls	
span number: 1	condition: good
span length: 130.0'	alterations: unknown
total length: 134.0'	floor/decking : concrete deck over steel stringers
roadway width: 20.0'	other features: steel angle guardrails

HISTORICAL DATA

erection date: 1929
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number Y 148.

sign. rating: 33
evaluation: NRHP non-eligible (typically configured example of standard truss type)

Inventoried by: Clayton B. Fraser 21 September 1994

Blue River Bridge

JACK16

GENERAL DATA

structure no.: Z 901	city/town: 2.9 miles west of Grandview
county: Jackson	feature inters.: Blue River
	highway route: State Highway 150
	highway distr.: 4
	current owner: Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure: steel, 6-panel, rigid-connected Pratt through truss
substructure: concrete abutments and wingwalls

span number: 1	condition: good
span length: 120.0'	alterations: none
total length: 124.0'	floor/decking : concrete deck over steel stringers
roadway width: 20.0'	other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 channels with batten plates; vertical: 4 angles with lacing; diagonal: 2 angles with batten plates; lateral bracing: 1 angle; floor beam: I-beam, field-bolted to vertical; angle guard-rails with concrete balustrade over wingwalls; bridge plate: BRIDGE 73-201 / JACKSON COUNTY / 1932

HISTORICAL DATA

erection date: 1932
erection cost: \$12,558.25 (contract amount)
designer: unknown
fabricator : Inland Steel Company, East Chicago IN
contractor: F.H. Freeto, Independence MO

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number Z 901; Jackson County Court Record, Book 68, page 592 (26 July 1932) - located at Jackson County Courthouse, Independence, Missouri; field inspection by Lon Johnson, 6 February 1991.

sign. rating: 41
evaluation: NRHP non-eligible (typically configured example of standard bridge type)

inventoried by: Clayton B. Fraser 21 September 1994

Gladstone Boulevard Overpass

JACK17

GENERAL DATA

structure no.: S026B31	city/town: Kansas City
county: Jackson	feature inters.: Anderson Avenue
	cadastral grid: S34, T50N, R32W
	highway route: Gladstone Boulevard
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel two-hinge deck arch
substructure: stone masonry abutments

span number: 1	condition: fair
span length: 60.0'	alterations: deck replaced
total length: 60.0'	floor/decking : concrete deck over steel stringers
roadway width: 40.0'	other features: six riveted plate girder arch ribs with one-angle lateral bracing; pin-connected cast iron bearing shoes; ornamental wrought iron guardrails with cast iron newels; cast iron Ionic columns at abutments

HISTORICAL DATA

erection date: 1897-98
erection cost: \$14,480.00
designer: D.A. Miles
fabricator : Wrought Iron Bridge Company, Canton OH
contractor : Wrought Iron Bridge Company, Canton OH

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S026B31; Kansas City Public Service Company, **History of Bridges and Viaducts**, page 25; field inspection by Mark Hufstetler, 4 February 1991.

sign. rating: 73
evaluation: NRHP eligible (outstanding early example of urban bridge construction)

inventoried by: Clayton B. Fraser 21 September 1994

Cliff Drive Overpass

JACK18

GENERAL DATA

structure no.:	S026B32	city/town:	Kansas City
county:	Jackson	feature inters.:	Chestnut Trafficway
		cadastral grid:	S34, T50N, R33W
		highway route:	Cliff Drive
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments with stone masonry wingwalls		
span number:	1	condition:	good
span length:	82.0'	alterations:	none
total length:	82.0'	floor/decking :	asphalt over earth fill
roadway width:	42.0'	other features:	six arch ribs corbeled beneath arch barrel; recessed panels on arch spandrels; classical guardrails with cast concrete balusters; bronze plate: ERECTED 1920 / BY BOARD OF PARK COMMISSIONERS / KANSAS CITY MO / H.B. THOMPSON CONTRACTOR

HISTORICAL DATA

erection date:	1920
erection cost:	\$20,000.00+
designer:	Kansas City Board of Park Commissioners
fabricator :	none
contractor:	H.B. Thompson / Concrete Construction Company
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S026B32; Roy Ellis, "A Civic History of Kansas City, Missouri," Ph.D. Dissertation, Columbia University, 1930, pages 90-92; Carrie Westlake Whitney, Kansas City, Missouri: Its History and Its People 1808-1908 (Chicago: S.J. Clarke Publishing Company, 1908), page 579; A Story of the Development of the Parks and Recreation Department Published on occasion of its Diamond Jubilee, 1892-1967 , page 8; Kansas City Park Department, Cowtown 1890 Becomes City Beautiful 1962: The Story of Kansas City's Parks , page 55; Office of City Council of Kansas City, Index to Appropriations , Ordinance 34530, Book 86, page 163 (5 May 1920); William H. Wilson, The City Beautiful Movement (Baltimore: Johns Hopkins University Press, 1989), pages 99-125; field inspection by Lon Johnson, 4 February 1991.
sign. rating:	53
evaluation:	NRHP possibly eligible (well-preserved concrete structure associated with Kansas City's park and boulevard system)

Inventoried by: Clayton B. Fraser 21 September 1994

Lexington Avenue Viaduct

JACK19

GENERAL DATA

structure no.: S026B33	city/town: Kansas City
county: Jackson	feature inters.: Chestnut Trafficway
	cadastral grid: S34, T50N, R33W
	highway route: Lexington Avenue
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel plate deck girder	
substructure: concrete abutments with steel bent piers on concrete pedestals	
span number: 5	condition: good
span length: 95.0'	alterations: remodeled, 1907; repairs, new deck, sidewalk and rails, 1970
total length: 386.0'	
roadway width: 43.0'	floor/decking : concrete deck over steel stringers
	other features: lattice guardrail on one side with Jersey barrier and aluminum tube guardrails at sidewalk

HISTORICAL DATA

erection date: 1900-01
erection cost: unknown
designer: Waddell and Hedrick, Kansas City MO
fabricator : unknown
contractor: Central Electric Railway Company, Kansas City MO

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S026B33; Reed McKinley, Director of Public Works, to Powell C. Groner, President, Kansas City Public Service Company, correspondence, 15 July 1948; Powell C. Tobin Company is Low on Food Terminal Link," Kansas City Times , 1 May 1940; "Avenue to Food: Ground Broken for \$305,000 Viaduct to Link Rails and City Market," Kansas City Star , 9 July 1940; field inspection by Lon Johnson, 4 February 1991.		
sign. rating:	41		
evaluation:	NRHP non-eligible (typical example of Depression-era urban construction)		

inventoried by: Clayton B. Fraser 23 September 1994

Twelfth Street Trafficway

JACK21

GENERAL DATA

structure no.:	S030B11	city/town:	Kansas City
county:	Jackson	feature inters.:	railroad yard
		cadastral grid:	S6, T49N, R33W
		highway route:	12th Street
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	double-deck concrete through arch with 45 deck girder approach spans		
substructure:	concrete abutments and post piers		
span number:	1; 45	condition:	good
span length:	140.0'	alterations:	bridge rehabilitated,
total length:	2054.0'	floor/decking :	concrete deck
roadway width:	52.0'	other features:	modern metal pipe guardrails, upper solid concrete balustrade with recessed panels

HISTORICAL DATA

erection date:	1913-14
erection cost:	\$577,330.49
designer:	Waddell and Harrington, Kansas City MO
fabricator :	none
contractor:	Graff Construction Company, Seattle WA
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S030B11; Kansas City Times , 10 April 1913; Kansas City Journal , 27 August 1913; Kansas City Public Service Company, History of Bridges and Viaducts ; E.E. Howard, "The Twelfth Street Trafficway Viaduct, Kansas City, Missouri," American Society of Civil Engineers Transactions , Paper No. 1357 presented at the meeting of September 1, 1915, pages 485-487, 525, 531-533; Kansas City Star , 28 February 1965; Kansas City Star , 9 April 1965; field inspection by Mark Hufstetler, 4 February 1991.
sign. rating:	77
evaluation:	NRHP eligible (Missouri's foremost urban viaduct)

inventoried by: Clayton B. Fraser 23 September 1994

Bluff Street Bridge

JACK22

GENERAL DATA

structure no.:	S030B12	city/town:	Kansas City
county:	Jackson	feature inters.:	railroad tracks
		cadastral grid:	S6, T49N, R33W
		highway route:	St. Louis Road
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure: steel, 7-panel, rigid-connected Pratt through truss, skewed
substructure: concrete (north), 2 concrete piers set in stone wall (south), concrete on top of both (bridge raised)

span number:	1	condition:	fair
span length:	160.0'	alterations:	none
total length:	163.0'	floor/decking :	concrete deck over steel stringers
roadway width:	41.0'	other features:	upper chord / end post: box beam comprised of 4 angles with continuous plates and lacing; lower chord: box beam comprised of 4 angles with lacing; vertical: box beam comprised of 4 angles with double lacing; diagonal: box beam comprised of 4 angles with lacing or built-up I-beam comprised of 4 angles with lacing; strut: 4 angles with lacing; floor beam: I-beam, field-bolted to verticals; guard-rail: 2 channels

HISTORICAL DATA

erection date: 1914-15
erection cost: unknown
designer: G.E. Tebbets
fabricator : unknown
contractor: Kansas City Terminal Railway Company

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S030B12; Kansas City Public Service Company, History of Bridges and Viaducts, pages 6-7.

sign. rating: 69
evaluation: NRHP determined eligible (noteworthy urban truss viaduct)

inventoried by: Clayton B. Fraser 23 September 1994

Beardsley Road Viaduct

JACK24

GENERAL DATA

structure no.: S030B42	city/town: Kansas City
county: Jackson	feature inters.: Hillside Drainage
	cadastral grid: S6, T49N, R33W
	highway route: Beardsley Road
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: concrete deck girder	
substructure: concrete abutments and wingwalls; concrete post piers	
span number: 16	condition: fair
span length: 40.0'	alterations: interstate highway recently built overhead
total length: 640.0'	floor/decking: concrete deck
roadway width: 40.0'	other features: Armco guardrails

HISTORICAL DATA

erection date: 1917	
erection cost: unknown	
designer: unknown	
fabricator: none	
contractor: unknown	
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number S030B42.
sign. rating: 33	
evaluation:	NRHP non-eligible (undistinguished example of mainstay structural type, largely undocumented)

inventoried by: Clayton B. Fraser 23 September 1994

Manchester Trafficway

JACK26

GENERAL DATA

structure no.:	S047B21	city/town:	Kansas City
county:	Jackson	feature inters.:	Big Blue River
		cadastral grid:	S7, T49N, R32W

		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	steel plate deck girder		
substructure:	concrete abutments, wingwalls and spill-through piers		
span number:	4	condition:	good
span length:	100.0'	alterations:	none
total length:	360.0'	floor/decking :	concrete deck over steel stringers
roadway width:	46.0'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1940
erection cost:	\$148,400.00
designer:	Ash, Howard, Needles & Tammen, Kansas City MO
fabricator :	Kansas City Bridge Company, Kansas City MO
contractor:	Kansas City Bridge Company, Kansas City MO
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S047B21; "Conquering the Wilderness of the Blue Valley with Viaducts and Trafficways," Kansas City Star , 29 September 1935; Kansas City Chamber of Commerce, Where These Rocky Bluffs Meet: Including the Story of the Kansas City Ten-Year Plan (Kansas City: Kansas City Chamber of Commerce, 1939), 213-17.
sign. rating:	43
evaluation:	NRHP non-eligible (undistinguished example of long-span beam bridge construction)

inventoried by: Clayton B. Fraser 23 September 1994

East 23rd Street Viaduct

JACK27

GENERAL DATA

structure no.: S048B11	city/town: Kansas City
county: Jackson	feature inters.: Big Blue River
	cadastral grid: S12, T49N, R32W
	highway route: 23rd Street Trafficway
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel variable-depth plate girder	
substructure: concrete abutments, wingwalls and spill-through piers	
span number: 18	condition: good
span length: 110.0'	alterations: none
total length: 1639.0'	floor/decking : concrete deck over steel stringers
roadway width: 42.0'	other features: steel balustrade guardrails with curved concrete bulkheads; sidewalks on both sides of roadway; bridge plate: DEPARTMENT OF PUBLIC WORKS / CITY OF KANSAS CITY, MISSOURI / R.E. McELROY, CITY MANAGER / MATTHEW S. MURRAY, DIRECTOR OF PUBLIC WORKS / N.W. HYLAND, ASSISTANT DIRECTOR OF PUBLIC WORKS / EAST TWENTY-THIRD STREET VIADUCT / 1936 / BLACK & VEATCH CONSULTING ENGINEERS / WISCONSIN BRIDGE & IRON COMPANY CONTRACTOR

HISTORICAL DATA

erection date: 1936-38	
erection cost: \$531,000.00	
designer: Black & Veatch, Consulting Engineers	
fabricator : Wisconsin Bridge & Iron Company, Milwaukee WI	
contractor: Wisconsin Bridge & Iron Company, Milwaukee WI	
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S048B11; "Conquering the Wilderness of the Blue Valley with Viaducts and Trafficways," <i>Kansas City Star</i> , 29 September 1935; <i>Kansas City Star</i> , 8 June 1938; <i>Kansas City Times</i> , 9 June 1938.
sign. rating: 51	
evaluation:	NRHP possibly eligible (noteworthy long-span urban viaduct)

inventoried by: Clayton B. Fraser 23 September 1994

27th Street Viaduct

JACK28

GENERAL DATA

structure no.:	S051B31	city/town:	Kansas City
county:	Jackson	feature inters.:	Vine Street
		cadastral grid:	S9/16, T49N, R33W
		highway route:	27th Street
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure: concrete open spandrel arch, with arched deck girder approach spans
substructure: concrete abutments, wingwalls and spill-through piers

span number:	1; 4; 2	condition:	good
span length:	120'; 40'; 45'	alterations:	bridge rehabilitated, 1949
total length:	371.0'	floor/decking:	concrete deck
roadway width:	40.0'	other features:	concrete guardrails with decorative molded balusters; decorative pedestrian stairways on both sides; sidewalks carried on decorative concrete corbels

HISTORICAL DATA

erection date: 1917
erection cost: \$88,500 (estimate)
designer: Hedrick & Hedrick, Kansas City MO
fabricator: none
contractor: McMillan Contracting Company, Kansas City MO

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S051B31; Roy Ellis, **A Civic History of Kansas City, Missouri**, published in Springfield, Missouri, 1930, pages 91, 93; promotional literature for Harrington, Howard and Ash, Consulting Engineers, Kansas City, Missouri, from the Kansas City Public Library; Carrie Westlake Whitney, **Kansas City, Missouri: Its History and Its People 1808-1908** (Chicago: S.J. Clarke Publishing Company, 1908), pages 592, 595; "The New Twenty-Seventh Street Viaduct over Vine Street," **Kansas City Times**, 27 December 1916; George E. Kessler, "The Kansas City Park System and Its Effect on the City Plan," **Good Roads**, 2 June 1917, pages 321-24; Kansas City Parks Department, **Cowtown 1890 Becomes City Beautiful 1962: The Story of Kansas City's Parks**, page 10; William H. Wilson, **The City Beautiful Movement** (Baltimore: Johns Hopkins University Press, 1989), pages 122-25; field inspection by Lon Johnson, 4 February 1991.

sign. rating: 63
evaluation: NRHP possibly eligible (outstanding example of urban concrete bridge construction built as an integral part of Kansas City's boulevard system)

inventoried by: Clayton B. Fraser 23 September 1994

Oak Street Viaduct

JACK29

GENERAL DATA

structure no.:	S052B11	city/town:	Kansas City

fabricator :	Illinois U.S.A.
contractor:	W.A. Ross Construction Company

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S106B12; Primary System Bridge Record, located at the Missouri Highway and Transportation Department, Jefferson City MO; **Kansas City Times**, 20 September 1935; Kansas City Chamber of Commerce, **Where These Rocky Bluffs Meet: Including the Story of The Kansas City Ten-Year Plan**, (Kansas City: Chamber of Commerce of Kansas City, 1938), pages 177, 213; "Looking North-east over the Sixty-Third Street Viaduct which Provides a New Entrance into City," **Kansas City Times**, 11 September 1937; field inspection Mark Hufstetler, 5 February 1991.

sign. rating:	50
evaluation:	NRHP possible (long-span example of MSHD beam bridge design)

inventoried by: Clayton B. Fraser 22 February 1994

Little Blue Road Bridge

JACK43

GENERAL DATA

structure no.: S115B41	city/town: Kansas City
county: Jackson	feature inters.: Little Blue River
	cadastral grid: S11, T48N, R32W
	highway route: Little Blue Road
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel, 6-panel, rigid-connected Pratt through truss, with concrete deck girder approach spans	
substructure: concrete abutments, wingwalls and piers	
span number: 1	condition: fair
span length: 120.0'	alterations: unknown
total length: 197.0'	floor/decking : concrete deck over steel stringers
roadway width: 20.0'	other features: steel guardrails

HISTORICAL DATA

erection date: 1932
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S115B41.

sign. rating: 28
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Clayton B. Fraser 22 February 1994

Paseo Overpass

JACK45

GENERAL DATA

structure no.:	S128B11	city/town:	Kansas City
county:	Jackson	feature inters.:	77th Street
		cadastral grid:	S16, T48N, R33W
		highway route:	Paseo Boulevard
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	good
span length:	63.0'	alterations:	none
total length:	65.0'	floor/decking :	concrete over earth fill
roadway width:	28.0'	other features:	ornamental concrete guardrails with paneled concrete bulkheads; horizontal grooves cast in concrete on wingwalls; incised panels cast in concrete on arch spandrels; corbeled concrete stringcourse at springline and road level

HISTORICAL DATA

erection date:	1917
erection cost:	\$70,000.00 for both overpasses
designer:	Harrington, Howard and Ash, Kansas City MO
fabricator :	none
contractor:	H.H. Hannenkratt and D. Murno, Kansas City MO

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S128B11; Roy Ellis, **A Civic History of Kansas City, Missouri**, published in Springfield, Missouri, 1930, p. 91, 93; promotional literature for Harrington, Howard and Ash, Consulting Engineers, Kansas City, Missouri, from the Kansas City Public Library; Kansas City Public Service Company, **History of Bridges and Viaducts**; Carrie Westlake Whitney, **Kansas City, Missouri: Its History and Its People 1808-1908** (Chicago: S.J. Paseo Overpass

sign. rating: 56
evaluation: NRHP determined eligible (outstanding example of urban concrete bridge construction built as an integral part of Kansas City's boulevard system)

inventoried by: Clayton B. Fraser 22 February 1994

Hillcrest Road Bridge

JACK47

GENERAL DATA

structure no.:	S131B21	city/town:	Kansas City
county:	Jackson	feature inters.:	small creek
		cadastral grid:	S13/14, T48N, R33W
		highway route:	Hillcrest Road
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments, wingwalls and pier		
span number:	2	condition:	fair
span length:	20.0'	alterations:	original concrete wingwalls lengthened with historic stone retaining walls
total length:	40.0'	floor/decking :	asphalt over earth fill
roadway width:	20.0'	other features:	concrete guardrails with rectangular slots

HISTORICAL DATA

erection date:	1906
erection cost:	unknown
designer:	unknown
fabricator :	none
contractor:	Midland Bridge Company, Kansas City MO (probable)
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S131B21; Board of Park Commissioners of Kansas City, The Park and Boulevard System of Kansas City, Missouri , revision and reprint of 1914 edition, 1920, pages 24-25; Kansas City Parks Department, Cowtown 1890 becomes City Beautiful 1962: The Story of Kansas City's Parks , page 10; Missouri State Board of Agriculture, Highway Department, "Bridges and Culverts," Bulletin No. 5, August 1908, page 4.
sign. rating:	50
evaluation:	NRHP possibly eligible (early example of concrete arch construction)

inventoried by: Clayton B. Fraser 22 February 1994

Rhinehart Road Bridge

JACK48

GENERAL DATA

structure no.: S137B31	city/town: Kansas City
county: Jackson	feature inters.: Little Cedar Creek
	cadastral grid: S13/14, T48N, R32W
	highway route: Rhinehart Road
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel, 6-panel pin-connected Pratt pony truss
substructure: timber pile bent abutments and backwalls

span number: 1	condition: fair
span length: 100.0'	alterations: deck rehabilitated 1986
total length: 102.0'	floor/decking : timber deck over steel stringers
roadway width: 15.0'	other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars, 4 angles with batten plates; vertical: 4 angles with lacing; diagonal: 2 punched rectangular eyebars; counter: 1 round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; floor beam: I-beam, field-bolted to vertical; guardrail: lattice; endpost-mounted builder's plate: INTER-STATE BRIDGE CO. / KANSAS CITY MO / 1904

HISTORICAL DATA

erection date: 1904
erection cost: unknown
designer: Interstate Bridge Company, Kansas City MO
fabricator : Carnegie Steel Company, Pittsburgh PA
contractor: Interstate Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S137B31; field inspection by Lon Johnson, 9 February 1991.

sign. rating: 46
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Clayton B. Fraser 23 February 1994

Elm Avenue Bridge

JACK50

GENERAL DATA

structure no.:	S142B31	city/town:	Kansas City
county:	Jackson	feature inters.:	small creek
		cadastral grid:	S20, T48N, R32W
		highway route:	Elm Avenue
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	3-panel, pin-connected Pratt pony truss		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	fair
span length:	36.0'	alterations:	truss possibly moved to this location
total length:	38.0'	floor/decking :	concrete deck over steel stringers
roadway width:	15.6'	other features:	Armco over original lattice guardrails

HISTORICAL DATA

erection date:	c1900
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor :	unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S142B31.

sign. rating:	12
evaluation:	NRHP non-eligible (typically configured, small-scale example of common structural type, possibly moved to this location)

Inventoried by: Clayton B. Fraser 23 February 1994

Dodson Bridge

JACK51

GENERAL DATA

structure no.: S146B31	city/town: Kansas City
county: Jackson	feature inters.: Big Blue River
	cadastral grid: S22, T48N, R33W
	highway route: Prospect Avenue
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel, 6-panel, rigid-connected Pratt through truss, with concrete deck girder approach spans

substructure: concrete abutments, wingwalls and piers

span number: 1	condition: fair
span length: 122.0'	alterations: unknown
total length: 206.0'	floor/decking : concrete deck over steel stringers
roadway width: 20.0'	other features: steel angle guardrails

HISTORICAL DATA

erection date: 1930

erection cost: unknown

designer: E.M. Stayton and N.T. Veatch, Jr., Consulting Engineers

fabricator : unknown

contractor : unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S146B31; "Dodson Bridge over Blue River," original construction drawings by E.M. Stayton and N.T. Veatch, Jr., April 1930 - located at Kansas City Engineer's Office, Kansas City, Missouri.

sign. rating: 28

evaluation: NRHP non-eligible (typically configured example of standard bridge type)

inventoried by: Clayton B. Fraser 23 February 1994

Troost Avenue Viaduct

JACK52

GENERAL DATA

structure no.:	S147B21	city/town:	Kansas City
county:	Jackson	feature inters.:	85th Street, K.C.P.S.R.R. tracks, stream
		cadastral grid:	S20/21, T48N, R33W
		highway route:	Troost Avenue
		highway distr.:	4
		current owner:	City of Kansas City

STRUCTURAL DATA

superstructure:	rolled steel deck girder		
substructure:	concrete abutments, wingwalls and spill-through piers		
span number:	10	condition:	good
span length:	56.0'	alterations:	repaired after collision, 1984
total length:	381.0'	floor/decking :	concrete deck over steel stringers
roadway width:	48.5'	other features:	concrete post-and-rail guardrails

HISTORICAL DATA

erection date:	1943
erection cost:	\$147,640.69
designer:	Missouri State Highway Department
fabricator :	Salvage Section of War Production Board
contractor :	List and Weatherly Construction Company

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S147B21; files on primary system bridges, located at Missouri Highway and Transportation Department, Jefferson City MO; Missouri State Highway Commission, **Thirteenth Biennial Report**, 1941-42, page 149; "Salvaged Steel Used in Kansas City Bridge," **Engineering News Record**, 2 September 1943, p. 3; field inspection Mark Hufstetler, 5 February 1991.

sign. rating:	48
evaluation:	NRHP possibly eligible (wartime bridge built using salvaged materials)

inventoried by: Clayton B. Fraser 26 September 1994

Bannister Road Overpass

JACK53

GENERAL DATA

structure no.: S153B22	city/town: Kansas City
county: Jackson	feature inters.: Blue River Road
	cadastral grid: S27, T48N, R33W
	highway route: Bannister Road
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: concrete rigid frame	
substructure: concrete abutments and wingwalls	
span number: 1	condition: good
span length: 37.0'	alterations: none
total length: 38.0'	floor/decking : concrete deck
roadway width: 20.5'	other features: recessed panels on concrete spandrel walls; fluted Art Moderne pylons at abutments; Arm-co guardrails

HISTORICAL DATA

erection date: 1931
erection cost: unknown
designer: unknown
fabricator : none
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S153B22; Elmer Napier, "Rigid-Frame Bridges," *Roads and Bridges*, April 1940, page 13; field inspection Mark Hufstetler, 5 February 1991.

sign. rating: 54
evaluation: NRHP possibly eligible (earliest example in state of this rare structural type)

inventoried by: Clayton B. Fraser 26 September 1994

Kenneth Road Bridge

JACK55

GENERAL DATA

structure no.: S245B11	city/town: Kansas City
county: Jackson	feature inters.: Big Blue River
	cadastral grid: S31, T47N, R33W
	highway route: Kenneth Road
	highway distr.: 4
	current owner: City of Kansas City

STRUCTURAL DATA

superstructure: steel, 6-panel, pin-connected Pratt through truss, with timber stringer approach spans

substructure: stone masonry piers, concrete/timber abutments

span number: 1	condition: fair
span length: 100.0'	alterations: none
total length: 158.0'	floor/decking : timber deck over steel stringers
roadway width: 14.5'	other features: upper chord / inclined end post: two channels with cover plate and lacing; lower chord: two rectangular eyebars; vertical: two channels with lacing (two square eyebars at the hip); diagonal: two rectangular eyebars; counter: 2 square eyebars with turnbuckles; lateral bracing: round rod with threaded ends; strut: four angles with lacing; portal strut: lattice; floor beam: riveted plate girder, U-bolted to lower chord pins; Armco guardrails

HISTORICAL DATA

erection date: c1900
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number S245B11; field inspection Mark Hufstetler, 6 February 1991.

sign. rating: 26
evaluation: NRHP non-eligible (typically configured example of mainstay structural type, poorly documented)

inventoried by: Clayton B. Fraser 26 September 1994

Blue Ridge Overpass

JACK56

GENERAL DATA

structure no.: 042700.1	city/town: Blue Summit
county: Jackson	feature inters.: Missouri State Route 12
	cadastral grid: S5, T49N, R32W
	highway route: Blue Ridge Boulevard
	highway distr.: 4
	current owner: Jackson County

STRUCTURAL DATA

superstructure: stone filled spandrel arch	
substructure: stone masonry abutments and wingwalls	
span number: 1	condition: good
span length: 70.0'	alterations: none
total length: 86.0'	floor/decking: asphalt over earth fill
roadway width: 56.4'	other features: ashlar stone masonry on spandrels, wingwalls, guardrails and arch barrel; concrete string-course with stone corbels on spandrel; builder's plate: BUILT BY FORRESTER-SWENSON CONSTRUCTION CO. / OSCAR KOELHER

HISTORICAL DATA

erection date: 1906	
erection cost: unknown	
designer: Oscar Koehler, Jackson County Surveyor	
fabricator: none	
contractor: Forrester-Swenson Construction Company	
references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 042700.1; Oscar Koehler, Jackson County Surveyor, "Good Roads and Safe Bridges," October 1908 - located at the Kansas City Public Library; field inspection Lon Johnson, 10 February 1991.	
sign. rating: 63	
evaluation: NRHP possibly eligible (outstanding example of stone arch construction)	

inventoried by: Clayton B. Fraser 26 September 1994

Santa Fe Railroad Overpass

JACK59

GENERAL DATA

structure no.:	072000.9	city/town:	northwest of Sibley
county:	Jackson	feature inters.:	Atchison, Topeka & Santa Fe Railway
		cadastral grid:	S34, T51N, R30W
		highway route:	County Road 72
		highway distr.:	4
		current owner:	Jackson County

STRUCTURAL DATA

superstructure:	steel, 5-panel, rigid-connected 2-angle Pratt pony truss, with timber stringer approach spans		
substructure:	timber pile bent abutments, wingwalls and piers, with steel pile bent piers at truss		
span number:	1	condition:	fair
span length:	53.0'	alterations:	unknown
total length:	125.0'	floor/decking :	timber deck
roadway width:	14.6'	other features:	timber guardrails

HISTORICAL DATA

erection date:	c1925
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor :	unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 072000.9; field inspection Mark Hufstetler, 6 February 1991.

sign. rating:	33
evaluation:	NRHP non-eligible (poorly documented example of uncommon structural type)

inventoried by: Clayton B. Fraser 26 September 1994

Blue Branch Bridge

JACK63

GENERAL DATA

structure no.:	147000.6	city/town:	Grain Valley
county:	Jackson	feature inters.:	Blue Branch
		cadastral grid:	S35, T49N, R30W
		highway route:	County Road 147
		highway distr.:	4
		current owner:	Jackson County

STRUCTURAL DATA

superstructure:	steel, 4-panel, rigid-connected Pratt pony truss		
substructure:	concrete abutments, wingwalls and piers		
span number:	3	condition:	fair
span length:	50.0'	alterations:	rehabilitated, 1940
total length:	150.0'	floor/decking :	concrete/concrete
roadway width:	20.0'	other features:	unknown

HISTORICAL DATA

erection date:	c1930
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor:	unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 147000.6.

sign. rating:	30
evaluation:	NRHP non-eligible (typical example of common structural type)

inventoried by: Clayton B. Fraser 26 September 1994

Wilson Street Bridge

JACK65

GENERAL DATA

structure no.:	212502.3	city/town:	Independence
county:	Jackson	feature inters.:	Small Creek
		cadastral grid:	S32, T50N, R32W
		highway route:	Wilson Street
		highway distr.:	4
		current owner:	Jackson County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	fair
span length:	45.0'	alterations:	unknown
total length:	82.0'	floor/decking :	asphalt over earth fill
roadway width:	32.0'	other features:	concrete guardrails with ornamental recessed panels

HISTORICAL DATA

erection date:	c1925
erection cost:	unknown
designer:	unknown
fabricator :	none
contractor :	unknown
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 212502.3.
sign. rating:	31
evaluation:	NRHP non-eligible (poorly documented, small-scale concrete arch bridge)

inventoried by: Clayton B. Fraser 26 September 1994

Little Blue River Bridge

JACK66

GENERAL DATA

structure no.: 243500.1	city/town: 2.2 miles west of Lake Tapawingo
county: Jackson	feature inters.: branch of Little Blue River
	cadastral grid:
	highway route: county road
	highway distr.: 4
	current owner: Jackson County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt pony truss	
substructure: concrete abutments and wingwalls with steel pile bent piers	
span number: 1	condition: fair
span length: 45.0'	alterations: truss probably moved to this location
total length: 81.0'	floor/decking : timber deck
roadway width: 15.9'	other features: timber guardrails

HISTORICAL DATA

erection date: c1900
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 243500.1.

sign. rating: 15
evaluation: NRHP non-eligible (typically configured, poorly documented example of common structural type).

inventoried by: Clayton B. Fraser 26 September 1994

Little Blue River Bridge

JACK67

GENERAL DATA

structure no.: 243500.5	city/town: 2.8 miles southeast of Unity Village
county: Jackson	feature inters.: East Fork of Little Blue River
	cadastral grid: S34, T48N, R31W
	highway route: county road
	highway distr.: 4
	current owner: Jackson County

STRUCTURAL DATA

superstructure: concrete filled spandrel arch	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 40.0'	alterations: partial replacement of collision-damaged guardrails
total length: 42.0'	floor/decking : earth fill over concrete
roadway width: 17.5'	other features: concrete guardrails with rectangular incised panels

HISTORICAL DATA

erection date: 1911	
erection cost: \$2648.00	
designer: Jackson County Surveyor	
fabricator : none	
contractor : Midland Bridge Company, Kansas City MO	
references:	Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 243500.5; Jackson County Court Record, Book 47, page 238 (8 May 1911), page 273 (1 June 1911), page 477 (2 October 1911), page 485 (4 October 1911) - located at Jackson County Courthouse, Independence, Missouri; field inspection Mark Hufstetler, 6 February 1991.
sign. rating: 48	
evaluation:	NRHP possibly eligible (relatively early example of concrete arch bridge construction)

inventoried by: Clayton B. Fraser 26 September 1994

Mouse Creek Bridge

JACK68

GENERAL DATA

structure no.: 243501.4	city/town: Lee's Summit
county: Jackson	feature inters.: Mouse Creek
	cadastral grid:
	highway route: Sampson Road
	highway distr.: 4
	current owner: Jackson County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt half-hip pony truss	
substructure: unknown	
span number: 1	condition: fair
span length: 50.0'	alterations: unknown
total length: 52.0'	floor/decking : timber deck
roadway width: 16.0'	other features: lattice guardrails

HISTORICAL DATA

erection date: c1900
erection cost: unknown
designer: unknown
fabricator : unknown
contractor : unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 243501.4.

sign. rating: 26
evaluation: NRHP non-eligible (typical example of common structural type)

Inventoried by: Clayton B. Fraser 26 September 1994

Bridge

JACK69

GENERAL DATA

structure no.: 243502.3	city/town: Lee's Summit
county: Jackson	feature inters.: Cedar Creek
	cadastral grid:
	highway route: Longview Road
	highway distr.: 4
	current owner: Jackson County

STRUCTURAL DATA

superstructure: steel, 4-panel, pin-connected Pratt pony truss, with timber stringer approach spans	
substructure: stone masonry abutments	
span number: 1	condition: fair
span length: 37.0'	alterations: unknown
total length: 128.0'	floor/decking : timber deck
roadway width: 15.8'	other features: timber guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 243502.3.

sign. rating: 25
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Clayton B. Fraser 26 September 1994

Marble Creek Bridge

JACK72

GENERAL DATA

structure no.:	297000.4	city/town:	east of Tarsney Lakes
county:	Jackson	feature inters.:	Marble Creek
		cadastral grid:	S19/30, T48N, R29W
		highway route:	County Road 297
		highway distr.:	4
		current owner:	Jackson County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	stone masonry abutments and wingwalls		
span number:	1	condition:	fair
span length:	43.0'	alterations:	none
total length:	48.0'	floor/decking :	earth fill over concrete
roadway width:	16.3'	other features:	incised panels on solid concrete guardrails and spandrel walls

HISTORICAL DATA

erection date:	1911
erection cost:	unknown
designer:	Jackson County Surveyor (probable)
fabricator :	none
contractor :	J.C. Brown

references: Missouri Highway and Transportation Department Structure Inventory and Appraisal: Structure Number 297000.4; Jackson County Court Record, Book 47, page 233 (3 May 1911) - located at Jackson County Courthouse, Independence, Missouri; field inspection Mark Hufstetler, 6 February 1991.

sign. rating:	47
evaluation:	NRHP possibly eligible (well-preserved, early example of concrete bridge construction)

Inventoried by: Clayton B. Fraser 26 September 1994

Sni-A-Bar Creek Bridge

JACK73

GENERAL DATA

structure no.:	302000.6	city/town:	north of Lone Jack
county:	Jackson	feature inters.:	branch of Sni-A-Bar Creek
		cadastral grid:	S6, T47N, R29W
		highway route:	County Road 302
		highway distr.:	4
		current owner:	Jackson County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments and wingwalls

span number: 1

span length: 140.0'

total length: 430.0'

roadway wdt.: 40.0'

superstructure: steel, rigid-connected tied arch, with steel stringer approach spans

substructure: concrete abutments, wingwalls and spill-through piers

floor/decking: concrete deck over steel stringers

other features: arch rib: two built-up channels with slotted cover plates; lower chord: two built-up channels with batten plates; vertical: I-beam; strut: variable-depth plate girder; upper later bracing: plate girder; floor beam: I-beam; sidewalks with lattice guardrails cantilevered from both sides

This medium-scale steel bridge carries U.S. Highway 40 over the Blue River in Kansas City. As described by the state highway department, "The superstructure consists of six 45' steel I-beam spans and one 140' steel arch. The Substructure is of concrete bents and piers, the bents being supported by piling and the piers carried to rock." The 140-foot span was configured as a rigid-connected tied arch, with plate girder struts and lateral braces and built-up box-beam arch ribs. The Blue River Bridge was engineered by the Missouri State Highway Department in 1933. Designating the project as Project NRM-352A, the agency solicited competitive proposals in September. That month the state highway commission awarded contracts to build the structure to Gerard Knutson, the Davis Construction Company and the Lam Construction Company. The contractors apparently completed the bridge the following year for \$118,492.00. Since that time the bridge has functioned in place, with only maintenance-related repairs.

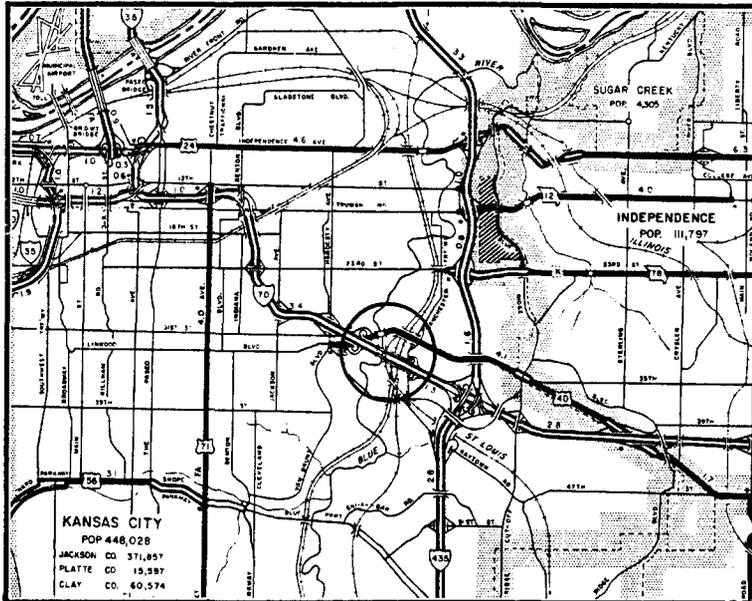

In the 1930s MSHD typically used riveted Parker through trusses as a standard design for 140-foot steel spans. The tied arch of the Blue River Bridge represents a noteworthy departure from standard practice for the agency. Tied arches had been used for almost a century before the construction of this bridge, beginning with the bowstring arch-truss patented by New York engineer Squire Whipple in 1840. In the 1860s and 1870s, numerous bowstrings were erected on Missouri's roads by the counties, but the structural type was eventually superseded by pinned trusses in the 1880s. The highway department delineated riveted trusses for its standard long-span steel designs in the late 1910s and 1920s but did not employ the steel arch to any extent before MSHD engineers decided to experiment with this span in Kansas City. The reason for this experimentation is unclear: perhaps aesthetics determined the structural type, as suggested by the variable-depth struts. MSHD also explored other structural types during this biennium, designing its first suspension bridge (CAMD05) and its first cantilevered through truss (MILLO2). The Blue River Bridge was completed successfully, but the tied arch was never

embraced by the highway department as a standard design, although MSHD experimented later in the decade with the nation's first cantilevered tied arch (STLO09). The Blue River Bridge is thus significant as an uncommon instance of experimentation by an agency not generally known for its bridge innovation.

In March 1887 Congress granted a charter to build a bridge across the Missouri River at Kansas City, "said bridge to provide for the passage of railway trains, and free passage shall be accorded to wagons and vehicles of all kinds, and for the transit of animals and for foot-passengers." This initiated what would prove to be a 24-year process fraught with failures and delays. The original charter holders—the Chicago, Kansas City and Texas Railway Company [CKC&T]—obtained approval of the bridge's fixed-span, high-level design from the War Department in February 1889. The stone piers were built before local control of the bridge was transferred to the Kansas City Bridge and Terminal Company [KCB&T] in 1890. (Apparently, the CKC&T still maintained some degree of involvement in the project through a mortgage arrangement.) The partially completed structure became known as the Winner Bridge after W.E. Winner, president of the KCB&T, but the bridge and terminal company was slow in continuing work on the structure, due probably to the depressed economy that followed the Panic of 1893. In March 1894 Congress granted an extension of time, while deleting the provision for free passage of wagons, stock and pedestrians. A year later the CKC&T was acquired by the Kansas City and Atlantic Railroad Company [KC&A], and with this transfer went the mortgage on the bridge. Nationally known engineer J.A.L. Waddell was then commissioned to re-design the Winner Bridge, using his patents for vertical-lift-bridge machinery. Waddell delineated a pin-connected truss with a lift span of 425 feet, to be built on the original piers.

With inadequate funding, the project lay dormant through the rest of the decade. In 1901 Winner lost control of the bridge through foreclosure by the KC&A. Local control was then turned over to Theodore Bates and the North End Terminal Company. Bates was no more effective in building the bridge than his predecessors, however, and it was not until the Union Bridge and Terminal Railroad Company [UB&T] acquired the bridge holdings in 1903 that prospects for the structure's completion began to brighten. A subsidiary of the Chicago, Burlington and Quincy Railroad [CB&Q] and the Armour and Swift meat packing plants, the UB&T was better financed than

the other rail companies. Still, the UB&T was slow to undertake the construction project. Congress granted further time extensions in 1904 and again in 1907. Waddell was again called in to re-design the bridge, this time by F.W. Fratt, president of the UB&T. Waddell and his new partner John Harrington re-configured the bridge as a rigid-connected truss. They telescoped the hangers inside of the truss's vertical posts instead of letting them pass outside, they substituted concrete for cast iron in the counterweights, and positioned the weights at either end of the truss instead of at the panel points. They also changed the position of the operator's house and re-designed the lift machinery.

Now known as the Fratt Bridge, the structure was one step closer to completion. "Mr. Fratt and his associates, after long deliberation, decided to build their bridge," Waddell stated disgustedly, "but before they would make up their minds to adopt the lifting deck, they had a large working model made of it to scale and operated by electric power; and although this worked to perfection, they still were not satisfied until they had an expert committee of civil and mechanical engineers examine the plans, specifications, and model and report upon the efficiency and practicability of the design." Waddell described the design in his **Bridge Engineering**:

The bridge proper, i.e., the portion between the established harbor lines, and excluding the approaches, consists of three double-deck, riveted-truss spans, providing on the lower deck two standard railway tracks, and on the upper deck two street car tracks and separate roadways and sidewalks for vehicular traffic and pedestrians. To permit the passage of boats, one of the three spans contains a lifting deck, which consists of a double-track railway bridge floor, the metal thereof being nickel steel, as to reduce the weight to be lifted, with a lateral system that includes special wind chords, all supported by stiff hangers, also of nickel steel, from each panel of the upper trusses.

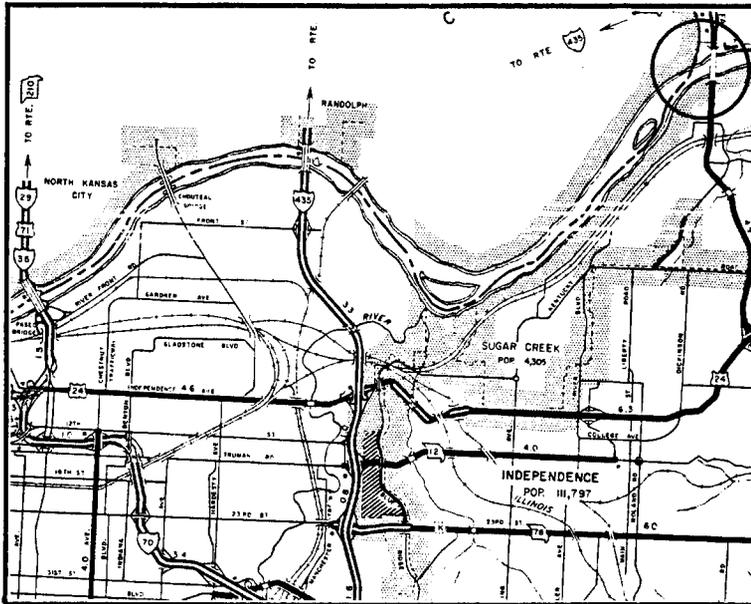

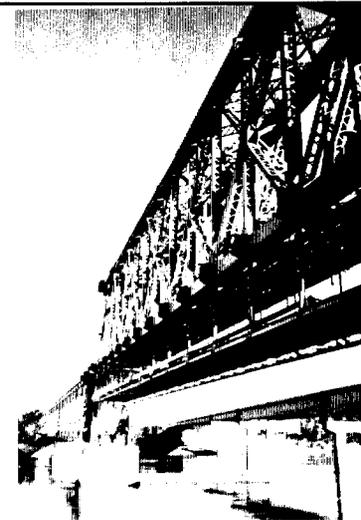

What the ungainly bridge lacked in aesthetics it compensated for in utility. Actual construction began in August 1909. Concrete piles for the substructure were cast and driven by the American Concrete Company of Chicago. The old stone piers were shortened and remodeled and new concrete ones built by James O'Connor and Son of Kansas City. The superstructure was erected by the McClintic-Marshall Construction Company of Pittsburgh. The American Electrical Company of St. Joseph, Missouri, fabricated and installed the electrical lift equipment. After more than two years of construction, the Fratt Bridge was finally opened to traffic in December 1911 for a total cost of \$2.5 million. "The opening of the new bridge means a new era for Clay County, and the north side of Kansas City," the **Kansas City Times** stated in 1911. "It means the development of 3,500 acres of land that the Armour-Swift-Burlington interests hold on the Clay County side."

The bridge soon acquired its more common name, the Armour-Swift-Burlington, or A.S.B., Bridge, under which it operates presently. The A.S.B. Bridge charged tolls for pedestrians, bicyclists, horses and riders, stock, horse-drawn carriages, automobiles, and even threshing machines. Tolls ranged from a nickel to 40 cents per trip. Those who used the bridge felt these tolls were too high, especially when those who built the bridge were only paid \$2 a day. Nevertheless, citizens were essentially at the mercy of Armour-Swift-Burlington until 1927, when the state bought the bridge and made it toll-free. The A.S.B. Bridge carried both rail and vehicular traffic with occasional repairs, remodelings and replacements of mechanical and structural components until 1987. That year the upper highway deck was closed and the approach spans leading to it removed. Since that time the A.S.B. Bridge has carried only railroad traffic.

The A.S.B. Bridge, in all its permutations, mirrored the prevailing engineering trends of the times. Waddell's 1894 design featured a 425-foot pin-connected span that carried the railroad and wagon decks on its lower and upper chords, respectively. As the project lay unfinished in the late 1890s, the progress of lift-bridge technology itself stagnated. This was due to Waddell himself, who held most of the controlling patents for lift bridge mechanics, and his disappointment with the Winner project and the Halstead Street Bridge in Chicago. Waddell resumed designing lift structures in 1907 with the re-design of the Fratt Bridge, which was followed by other spans in Keithsburg, Illinois, Sand Point, Idaho, and Portland, Oregon. The Fratt Bridge incorporated all that Waddell and Harrington had learned and devised for moveable-span bridges. It thus stands as a nationally important example of this infrequently used technology. The A.S.B. Bridge is historically important for its association with early Kansas City history and the role it played in linking the north and south sides of Kansas City across the Missouri River. Although substantially modified by the removal of its upper deck, the bridge is one of Missouri's most important spans.

The Big Blue River Bridge was built at a time when Kansas City endeavored to develop the Blue Valley, an area divided by the Blue River. Long considered a barrier to this development, the Blue River was bridged by numerous viaducts during the 1930s. The Big Blue River Bridge was one of three steel rigid frame structures designed in 1934 by the Missouri State Highway Department as part of extensive work on U.S. Highway 24 through the area [other structures: **JACK07**, **JACK08**]. As delineated by MSHD, the Big Blue River Bridge featured three 130-foot spans, with the steel deck girders rigidly fixed to steel pedestals to form a rigid-frame superstructure. In April 1934 the highway department solicited competitive bids for the bridges' construction. In May the department hired M.E. Gillioz to build the concrete pedestals and steel towers for this structure for \$51,739.00. In September the department hired Gillioz to erect the girder superstructure for \$68,415.95. Based in Monett, Missouri, Gillioz was responsible for the construction of numerous bridges throughout the state. A native Missourian, he started a construction business, the Gillioz Company, in 1914. The company was responsible for constructing both buildings and bridges. Gillioz worked on the three structures through 1934 and into 1935. By summer they were almost complete. "The new 1-million-dollar Winner road gateway into Kansas City from the east, which will carry traffic above the railroad tracks in the East Bottoms by a series of viaducts, rapidly is nearing completion," the **Kansas City Star** reported in August. Gillioz completed the Big Blue River Bridge later that year. The structure carried increasing vehicular traffic for over 40 years before the highway department undertook a major renovation in 1977. At that time, the original sidewalks were removed, the roadway widened, and new sidewalks added on brackets cantilevered from the spandrel beams. This marked the only substantial alteration of the bridge.

"For the period from November 1, 1932, to December 1, 1934, designs have been prepared and contracts let on 792 new structures," the highway department stated in 1935. Most of these design were for typically configured truss or beam bridges, with separate super- and substructural systems. For three structures in Jackson County, however, the department employed "steel rigid-space-frame" designs, which tied the superstructural girders rigidly with steel columns to form a single inflexible system. Steel rigid-frame bridges had been developed in the late 19th century and marketed extensively to the counties by bridge fabricators as the bedstead truss. Due primarily to their structural shortcomings, bedsteads largely fell from favor soon after the turn of the century in virtually all of the country except

Missouri. Eventually even Missouri counties stopped buying bedsteads. The rigid-frame design remained dormant in the state until the highway department revived it in the early 1930s with a limited number of urban viaducts and overpasses. But MSHD's use of rigid frames proved shortlived before World War II, limited primarily to Kansas City and St. Louis, and the department never adopted it as a structural standard. The only remaining examples in Missouri of this rather esoteric structural type are the three Jackson County structures built in 1934 and the Chouteau Avenue Viaduct in St. Louis [STLC10]. The Winner Road Bridge is thus technologically significant—despite its subsequent alteration—as a relatively rare example of what was essentially an experimental structural type for the state highway department.

until the highway department revived it in the early 1930s with a limited number of urban viaducts and overpasses. But MSHD's use of rigid frames proved shortlived before World War II, limited primarily to Kansas City and St. Louis, and the department never adopted it as a structural standard. The only remaining examples in Missouri of this rather esoteric structural type are the three Jackson County structures built in 1934 and the Chouteau Avenue Viaduct in St. Louis [STLC10]. The Winner Road Viaduct is thus technologically significant—despite its subsequent alteration—as a relatively rare example of what was essentially an experimental structural type for the state highway department.

substructure: concrete abutments, wingwalls and steel legs on concrete pedestals
floor/decking: concrete deck over steel stringers
other features: concrete guardrails with pipe over

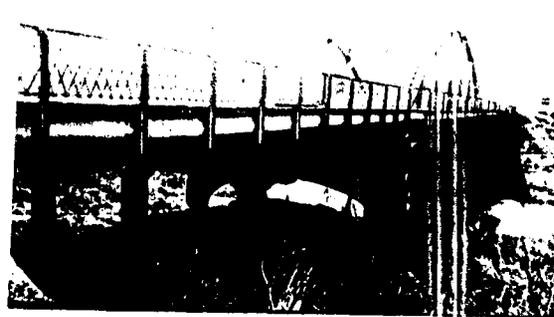

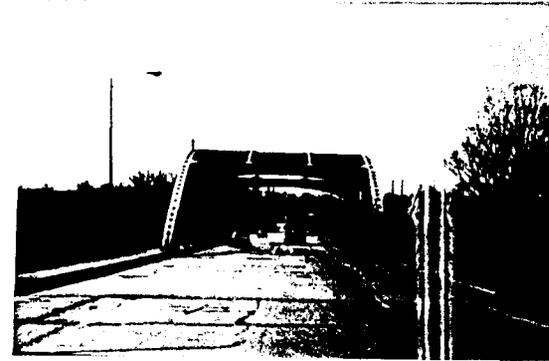

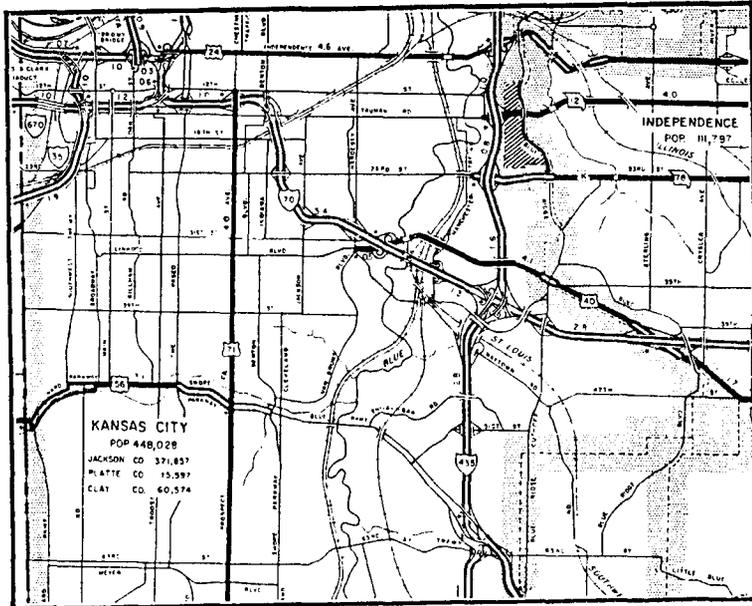

The Intercity Viaduct was constructed by the Kansas City Viaduct and Terminal Railway Company under an agreement with the Kansas City government in 1904. Spanning the Kaw River, as well as several on-grade city streets, the structure linked the cities of Kansas City, Missouri, and Kansas City, Kansas. It was comprised of a series of steel plate girder and deck truss spans, supported by steel piers. The Intercity Viaduct carried increasingly heavy traffic through the 1910s and 1920s, even outlasting the terminal railway company. By the early 1930s it was beginning to show considerable wear, and was under consideration for replacement by the state highway department when Congress passed legislation in 1934 that allowed federal monies to be used for the first time for road and bridge construction within municipalities. Taking advantage of the new act, the highway department undertook a number of urban road and bridge projects over the next three years. This included the reconstruction of the Intercity Viaduct. MSHD engineers produced the construction documents for the viaduct, generally following the spans and alignment of the existing structure. As delineated by MSHD, the new viaduct would feature a riveted deck truss over the Kaw River, with steel plate deck girders over Santa Fe, Madison, Mulberry and Ohio Streets. These latter spans were bolted rigidly to steel piers, forming a rigid-frame structure. A contract to erect the new Intercity Viaduct was awarded in February 1936 to M.E. Gillioz of Monett, Missouri. Gillioz apparently completed the structure later that year for a total cost of \$690,963.00. Since that time, the Intercity Viaduct has functioned in place, with the widening of its roadway and replacement of the guardrails as the most serious alterations.

As an important interstate link between the two Kansas Cities, the Intercity Viaduct has formed an integral part of the cities' street systems. The viaduct is also important as one of the grade separation projects funded through the New Deal's Hayden-Cartwright Act. Federal relief programs of the 1930s broke with past practice by allowing federal funds to be used for urban, as well as rural highways. Grade separation was a major focus of the highway department during this period, requiring commitment of much staff time. The Intercity Viaduct is technologically distinguished for its combination of two uncommon structural types. Steel deck trusses have never been common in Missouri, not have steel rigid-frame bridges. A regionally important example of these two bridge types, the structure is both technologically and historically significant.

superstructure: concrete deck girder

substructure: concrete abutments and wingwalls with concrete column piers

floor/decking: concrete deck

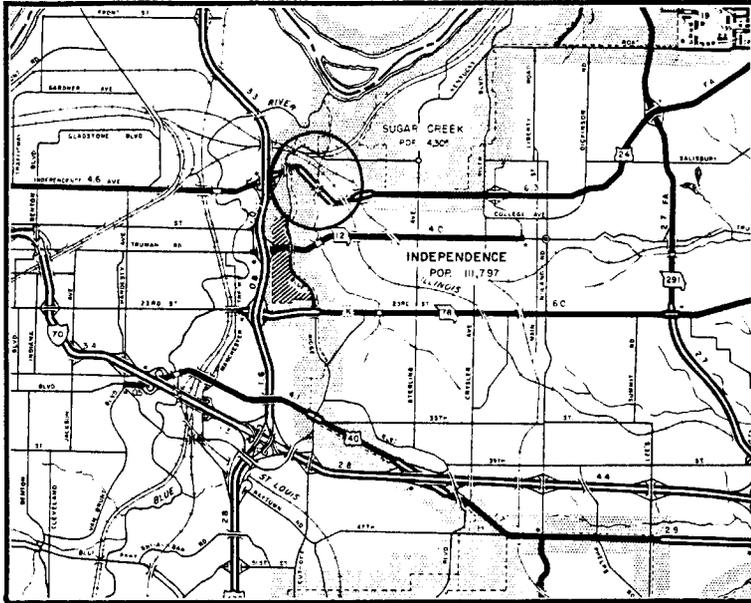

other features: MSHD standard concrete guardrails; curved girder haunches

This small-scale concrete bridge carries U.S. Highway 24 (Winner Road) over Rock Creek in the northeastern quadrant of Kansas City. The Rock Creek Bridge is comprised of three concrete deck girder spans with arched haunches, supported by concrete abutments and piers. The bridge is currently owned and maintained by the Missouri Highway and Transportation Department, but it was originally built by the Kansas City Terminal Railway, according to a typewritten bridge history produced by the Kansas City Public Service Company. Although uncorroborated by county records, the report states that the bridge was built here in 1911 as a double-track structure, which Jackson County later widened to accommodate vehicular traffic. The widening may have occurred in 1922, as indicated by the primary system bridge records at MHTD. Around 1940-41 the state highway department acquired the Rock Creek Bridge, and incorporated it into U.S. Highway 24. The MSHD standard concrete guardrails indicate that an additional widening occurred sometime after that.

Missouri was slow to embrace concrete as a bridge superstructural material after the turn of the century. It was not until the state highway department began promulgating standard concrete slab and girder designs in the 1920s that the counties began building all-concrete bridges with any regularity. The exceptions to this were the heavily urbanized areas—primarily Kansas City and St. Louis—where heavy traffic necessitated the use of concrete relatively early. Built by the city's major interurban railroad and later modified by the county for roadway use, the Rock Creek Bridge is distinguished among Missouri's concrete bridges as one of the earliest dateable concrete girder spans still in use. At least two subsequent widenings have diminished the interpretive value of the bridge, however.

superstructure: concrete rigid frame
substructure: concrete abutments and stone wingwalls
floor/decking: concrete deck
other features: stone parapets

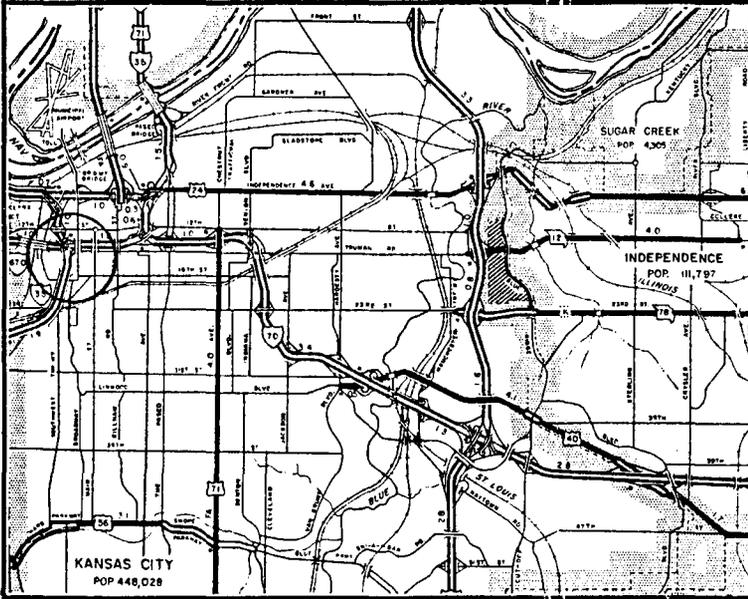

This single-span concrete bridge carries Ramp F of Interstate 35 over another ramp in Kansas City. The structure consists of a single-span concrete rigid frame, which features a slightly arched slab supported by concrete abutments with stone-veneer wingwalls. The Ramp F Overpass was designed by the Missouri State Highway Department as part of work on U.S. Highway 69 in Kansas City. On February 25, 1949, MSHD awarded a contract to build the bridge to the Bushman Construction Company. Presumably, Bushman finished the bridge later that year. Total cost: \$112,624.39. Since its completion, the overpass has carried vehicular traffic in essentially unaltered condition.

Developed by Westchester County, New York, in the early 1920s, the concrete rigid frame bridge became especially popular for federal relief projects during the 1930s. Both picturesque and practical, the flat or elliptically arched designs appealed to proponents of urban beautification. The Missouri State Highway Department used the concrete rigid frame sparingly in urban overpass situations, never adopting this structural type as a state standard. Only seven concrete rigid frame bridges have been identified by the statewide bridge inventory, all of which are in Kansas City or St. Louis. Although built relatively late in the milieu of rigid frame construction, the Ramp F Overpass is distinguished by its well-preserved condition. It is technologically significant as a relatively rare example of what was essentially an experimental structural type for the state highway department.

substructure: concrete abutments and spill-through piers
floor/decking: concrete deck over steel stringers
other features: upper chord and inclined end post: 2 built-up channels with cover and batten plates; lower chord: 2 built-up channels with lacing; vertical: 2 channels with lacing; diagonal: 2 channels with lacing or batten plates; lateral bracing: 2 angles; floor beam: I-beam, field-bolted to vertical; strut: 2 angles with lacing; steel guardrails

Alternately known as the Liberty Bridge and the Liberty Bend Bridge, this massive steel structure carries State Highway 291 over the Missouri River between Jackson and Clay counties. The multiple-span superstructure consists of two rigid-connected, cantilevered Warren trusses over the river's main channel, supported by concrete spill-through piers and approached on both sides by cantilevered Warren deck truss and deck girder spans. MHTD records indicate that the Liberty Bend Bridge was constructed in 1947. The configuration of the structure is indicative of those trusses designed by engineers Sverdrup and Parcel of St. Louis. Little else is known of this structure, however. The bridge's deck was replaced with steel grid in 1984, and part of the grid deck was replaced in 1986. With an overall length of 1,884 feet, the Liberty Bend Bridge continues to carry vehicular traffic.

Fourteen vehicular steel truss bridges over the Missouri River are included in Missouri's statewide historic bridge inventory. As a group, these bridges comprise some of the state's longest examples of truss bridge construction. Undertaken in the wake of World War II, the Liberty Bend Bridge was the last of the great river truss bridges built in Missouri. It has formed a regionally important crossing of the Missouri River. Featuring a cantilevered design, the Liberty Bend Bridge ranks among Missouri's most monumental examples of steel truss construction. With a span length of 460 feet and an overall length of 1884 feet, the multiple-span structure clearly ranks as a superlative example of its type. Its distinctive curved profile distinguished it among several great river bridges undertaken in the state by prominent St. Louis civil engineers Sverdrup and Parcel. Similarly configured structures undertaken by Sverdrup and Parcel include the Mark Twain Bridge in Hannibal, the Hermann Bridge and the Miami Bridge. As an important river crossing and a well-preserved example of large-scale bridge construction, the Liberty Bend Bridge is one of Missouri's more noteworthy highway trusses.

roadway wdt.: 40.0'

superstructure: concrete filled spandrel arch

substructure: concrete abutments and wingwalls

floor/decking: concrete/asphalt over concrete

other features: paneled concrete guardrails

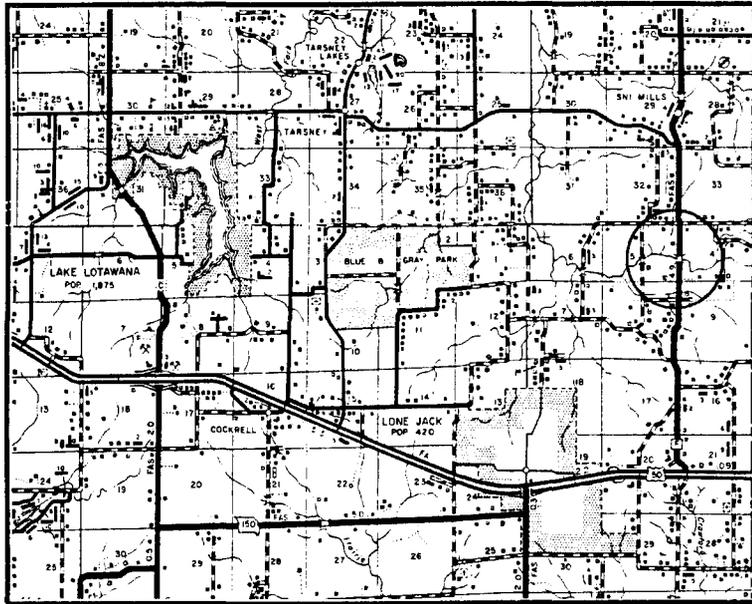

This single-span concrete bridge carries State Supplementary Route over Sni-A-Bar Creek about two miles northeast of Lone Jack. The structure features a filled spandrel arch with an elliptical profile, supported by concrete abutments. It is simply detailed, with recessed rectangular panels on the girder sides as the only architectural expression. The Sni-A-Bar Creek Bridge dates to 1911. In August of that year the Jackson County Court directed the county engineer to solicit competitive bids for several small-scale concrete bridges and culverts. After receiving the proposals in September, the county awarded a contract to build a 45-foot concrete arch with a 40-foot roadway on Cunningham Road between Lone Jack and Oak Grove. Low bidder at \$6945.00, the Illinois Steel Bridge Company was hired to build the structure. The Jacksonville, Illinois, firm labored on the structure that winter, reportedly working on the bridge in January 1912. The Sni-A-Bar Creek Bridge was apparently completed later in 1912. It has functioned in place since, with the recent addition of Armco guardrails as the only alteration of note.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. The Sni-A-Bar Creek Bridge is distinguished among these as one of the earliest dateable concrete arch bridges found in the state. Modestly scaled and simply detailed, it is noteworthy as an early, well-preserved example of concrete bridge construction in Missouri.

roadway wdt.: 40.0'	other features: six riveted plate girder arch ribs with one-angle lateral bracing; pin-connected cast iron bearing shoes; ornamental wrought iron guardrails with cast iron newels; cast iron Ionic columns at abutments

This small-scale steel overpass carries Gladstone Boulevard over Anderson Avenue at the southern edge of North Terrace Park in Kansas City. A two-hinge, steel deck arch, the structure is comprised of six plate girder ribs, supported on pinned bearing shoes by stone masonry abutments. Indicative of its 19th century origins, the Gladstone Boulevard Overpass features ornamental wrought iron guardrails with cast iron newels, cast iron Ionic columns at the abutments, and decorative rosettes on the spandrel ribs. The structure dates to 1897. In March of that year engineer D.A. Miles delineated the drawings for the bridge. On June 16th, the Kansas City Board of Public Works awarded a contract to fabricate and build the structure to Kansas City engineer J.W. Hoover, the local representative of the Wrought Iron Bridge Company. WIBCo worked on the overpass through the end of 1897 and into 1898, completing it on July 20, 1898. Total cost, including sidewalks, curbing and paving, was \$14,480.00. Since its completion, the Gladstone Boulevard Overpass has functioned in place in virtually original condition, with the replacement of its deck the only alteration of note.

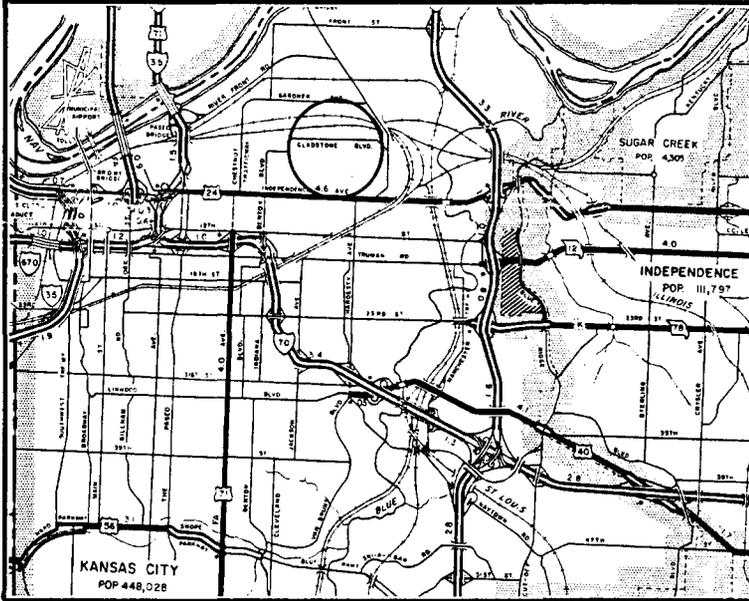

Based in Canton, Ohio, the Wrought Iron Bridge Company was the gargantuan creation of Ohio-born bridge building genius David Hammond. Hammond had established a modest bridge manufacturing business in 1864, incorporating it in 1871 as the Wrought Iron Bridge Company [WIBCo]. The firm marketed its bridges through the traditional means of solicitation and advertising. The company opened branch offices in several midwestern states from which it fielded general agents. Essentially traveling salesmen—some of whom also had engineering credentials—these agents visited with city and county officials, explained the company's bridge design and presented proposals for competitive bid lettings. WIBCo was represented in western Missouri by J.W. Hoover from his Kansas City office. Born near Canton, Ohio, in 1850, Hoover received a degree in civil engineering at the University of Michigan in 1875. After a short stint in Cincinnati, he accepted a position as an engineer for the Indianapolis Bridge Company in Indiana. Hoover moved back to Canton in 1878, where he worked as a civil engineer in the construction department of the Wrought Iron Bridge Company. In January 1884 he moved to Kansas City to act as one of WIBCo's general agents. Hoover remained WIBCo's representative until the company was absorbed in 1900 by the American Bridge Company.

Marketing extensively to the cities and counties (and perhaps participating in price-fixing arrangements with other firms), WIBco maintained an active presence in Missouri in the 1870s, 1880s and 1890s. The company's 1874 catalog listed iron structures built in Richmond, Independence, Georgia City and Hannibal. By 1885 WIBCo had erected some 2,100 linear feet of iron bridges in the state, including spans in Jackson, Cooper, Moniteau, Barton, Cole, Linn, Ray, Carroll, Green and Marion counties. WIBCo maintained an extensive roster of bridge types that ranged from the standard to the esoteric. Designed by a local engineer, the Gladstone Boulevard Overpass was atypical of WIBCo's bridge commissions in both its configuration and engineering source. It is today distinguished as the only example of its type identified by the statewide bridge inventory. And with its structural and ornamental elements essentially unaltered, the Gladstone Boulevard Overpass is one of the few 19th century urban structures remaining in place intact in the state. It is a significant, well-preserved remnant of Kansas City's early street system.

other features: six arch ribs corbeled beneath arch barrel; recessed panels on arch spandrels; classical guardrails with cast concrete balusters; bronze plate: **ERECTED 1920 / BY BOARD OF PARK COMMISSIONERS / KANSAS CITY MO / H.B. THOMPSON CONTRACTOR**

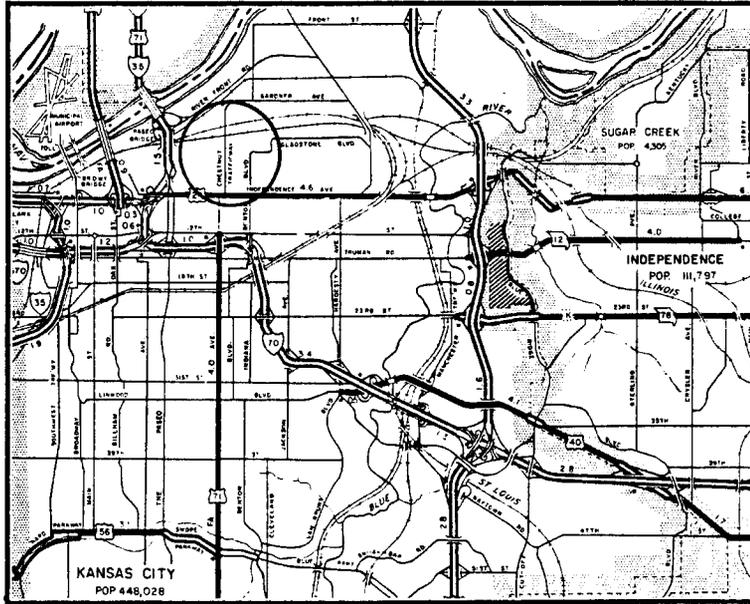

An important aspect in the development of late 19th century Kansas City was the incorporation of a series of parks and boulevards. As the city grew, city officials recognized the need to provide recreational areas for the public. A Board of Park Commissioners was appointed between 1893 and 1895, and in the decades to follow countless city parks were created. Parts of North Terrace Park, a 305-acre tract, were set aside between 1899 and 1920. Located along the bluffs of the Missouri River between Highland and Belmont, this park is cut across by the serpentine Cliff Drive, which was constructed between 1899 and 1904 and was once considered the most scenic drive in the country. In May 1920 the Board of Parks Commission appropriated \$20,000.00 for the construction of an overpass that would carry Cliff Drive over the Chestnut Trafficway, which runs north and south through the park. The rest of the cost was to be paid by the North Park District Fund. As designed, the Cliff Drive Overpass consisted of an elliptically shaped, filled spandrel arch with six arch ribs corbeled slightly beneath the arch barrel. The bridge featured stone masonry wingwalls, recessed panels on its concrete spandrels and a classical balustrade. The park board hired H.B. Thompson to build the bridge, which he completed with the Concrete Construction Company in 1920. Since that completion, the Cliff Drive Bridge has carried vehicular and pedestrian traffic in essentially unaltered condition.

Sponsored by August R. Meyer and designed by George E. Kessler, the Kansas City network of parks and boulevards represents one of the most stellar successes of the City Beautiful Movement in America. The North Terrace Park, overlooking the Missouri River, was one of the city's earliest and most popular attractions, and Cliff Drive formed a central feature in the park. The Cliff Drive Overpass was built in 1920 as the park was developing to maturity. As such it is a well-preserved, integral component of the city's park system. A handsomely proportioned and detailed structure, it is among the state's more noteworthy concrete arch bridges.

This multiple-span viaduct carries Lexington Avenue over the Chestnut Trafficway in North Terrace Park. The structure is comprised of five steel plate deck girder spans, supported by steel four-leg bent piers on concrete pedestals. The Lexington Avenue Viaduct was designed early in 1900 by the Kansas City engineering firm of Waddell and Hedrick for the Central Electric Railway Company. The structure was authorized that year by the city under Ordinance 14186, which stated: "Said steel railroad between the west line of Montgall Avenue and the east line of Chestnut Street shall be laid on a safe and substantial steel viaduct constructed so as to contain (in addition to the railroad right-of-way thereon) a wagon roadway and sidewalk for public use." Built in 1900-01, the structure carried electric interurban trains as well as vehicular and pedestrian traffic. In 1907, according to city records, the viaduct was remodeled. In 1926 the rail company was transferred through receivership to control of the Kansas City Public Service Company. The Lexington Avenue Viaduct functioned in unaltered condition until 1970, when its deck, sidewalks and guardrails were replaced.

City railroad companies such as Central Electric Railway Company, the Kansas City Terminal Railway and the Metropolitan Street Railway Company were responsible in whole or in part for the construction of many of Kansas City's viaducts. Their interest in uninterrupted traffic for their interurban trains and trolleys prompted them to construct the grade separations, many of which were built under joint agreements with the Department of Public Works to be used for both rail and vehicular traffic. Built in 1900, the Lexington Avenue Viaduct typifies this citywide trend. The structure is distinguished historically as one of the few remaining bridges in Missouri designed by the nationally important engineering firm of J.A.L. Waddell. The structure is technologically noteworthy as the oldest dateable vehicular steel girder in the state. Although it has been altered, the Lexington Avenue Viaduct is an important transportation-related resource.

In January 1940 the City Council of Kansas City deliberated over an ordinance which would authorize a contract for the \$300,000 Grand Avenue Viaduct. Considered a "vital connecting link in Kansas City's produce market area," this multiple-span structure connected the new city market with a million-dollar railroad food terminal to be built east of the A.S.B. Bridge. Kansas City engineers Ash, Howard, Needles & Tammen designed the structure, and in May the city solicited for bids to build it. The J.A. Tobin Construction Company submitted the lowest of nine bids at \$285,029.00. Director of Public Works Ralph E. Cameron awarded the contract, which estimated a six-month construction time. By July 1940 construction was underway. The groundbreaking consisted of a steam shovel ceremony for which Director of Public Works Arthur C. Everham, Assistant Director N.W. Hyland, contractor J.A. Tobin, and consulting engineer E.E. Howard were present. Although a traditional spade was on hand for the groundbreaking, Everham opted for the steam shovel, stating, "A spade would make it look like a WPA job. This is a modern construction job using modern equipment."

Initial construction work, which included the grading of the railroad yard, and general excavation began shortly after the groundbreaking. Although the cost of the viaduct was estimated at \$305,000, the overall cost for grading, building tracks and docks, paving, and a western approach to the municipal wharf pushed the price closer to \$800,000. When finished, the project included an administration building, open and covered docks, and other items necessary for a food distribution center. Completed in 1940, on the cusp of American entrance into World War II, the Grand Avenue Viaduct is a steel plate deck girder supported by concrete abutments, wingwalls, and hammerhead spill through piers. It functions as originally designed, with no serious alterations. The Grand Avenue Viaduct is today a well-preserved example of Depression-era urban construction.

span number: 1; 45	superstructure: double-deck concrete through arch with 45 deck girder approach spans
span length: 140.0'	substructure: concrete abutments and post piers
total length: 2054.0'	floor/decking: concrete deck
roadway wdt.: 52.0'	other features: modern metal pipe guardrails, upper solid concrete balustrade with recessed panels

The significance of the Twelfth Street Trafficway lies partially in its location. The viaduct comprised the main part of the Twelfth Street Trafficway, which was historically the main east-west route through the city, connecting uptown Kansas City with the West Bottoms, an industrial section that included "railroad yards, freight stations, warehouses, packinghouses, wholesale and manufacturing concerns, and the large stock yard interests, including a considerable percentage of the city's businesses." Until the Twelfth Street Trafficway was built, these sections of the city were connected by three indirect routes.

The first municipal authorization for a viaduct here was issued in January 1886, when the city permitted the Corrigan Consolidated Street Railway Company to "construct and operate a cable or electric railway on 12th Street from State Line to the eastern limits of the City of Kansas." In February 1887 the Metropolitan Street Railway Company hired the Phoenix Bridge Company of Philadelphia to build an iron viaduct along Twelfth Street; six months later a contract was let to the Kansas City Bridge and Iron Company for the same viaduct, presumably due to a default by Phoenix. The iron structure lasted for some twenty years before the city and the street railway companies began planning its replacement. The structure's principal drawback—other than its advancing age—was that it carried only railroad tracks. According to engineer E.E. Howard, "A roadway suitable for vehicular, as well as street-car, traffic... has been advocated for many years, and has been made a feature of more than one political campaign, and of franchise negotiations with street-railway interest." In November 1909 the city council passed an ordinance that extended the franchise of the railways to operate along Twelfth Street, provided they build the replacement structure. The viaduct's cost was estimated at \$1.3 million. The council enacted a similar ordinance in August 1911 calling for the receivers of the Metropolitan Street Railway Company to demolish the existing viaduct and construct a new structure.

Two more years passed before the viaduct inched closer to construction. The new viaduct was designed by pre-eminent Kansas City engineers Waddell and Harrington. The firm described the structure's general layout:

The improvement finally realized as the Trafficway extends from Liberty Street to Broadway, a distance of 3/4 mile, of which the viaduct occupies about 2,300 feet. The remaining portion consists of earth embankments and cuts, with the usual

street improvements on Twelfth Street, and the regrading of certain side streets to intersect its new grade. A street 60 ft. wide is thus provided on a continuous grade of about 5.5% for a distance of 3,500 ft., substantially from end to end of the improvement. It was physically impossible, without involving prohibitory expense and damage to existing structures, to extend the end of the grade in either direction, so the gradient practically fixed itself. To accommodate traffic desiring a less steep grade, and willing, for such advantage, to travel by a less direct route, a roadway on a lower deck is provided, with a grade of about 2.5 per cent. This lower roadway begins one block east of the upper one and extends to the bluff, a distance of 1,800 ft.; thus enabling all classes of traffic to avoid the grade crossings over the heavy service railway tracks on the street below. Ascending roadways or streets alongside the bluff from the end of the lower deck will terminate in streets at the summit of the hill, giving easy grades, although by indirect routes for team traffic bound up town.

With the structure's design completed, the Kansas City Board of Public Works finally solicited competitive bids for its construction in April 1913. Estimating the cost at between \$600,000 and \$630,000, the city planned to fund it with bond proceeds and \$200,000 from the Metropolitan Street Railway Company, which would then be entitled to use the viaduct until 1925. The city took a number of precautions to ensure that only financial stable companies would bid: it required that all bids be accompanied by certified checks equal to 5 percent of all bids under \$10,000 and 25 percent of those above \$10,000; and a surety bond equal to 75% of the gross amount of the bond.

In August 1913 the Graff Construction Company of Seattle was awarded the construction contract, but not without some difficulty. Graff complained about the Board of Public Works' stringent contract requirements, stating that the financial status of his company should not be questioned as long as he was capable of completing the job. Nevertheless, Graff presented his credentials and qualifications to the board. "We make a specialty of reinforced concrete work," Graff told the board. "We propose to build a structure which will be a monument to Kansas City as well as to the consulting engineers who designed it. And we intend to complete it within the time specified in the contract." Included among Graff's references was the prestigious engineering firm of Waddell and Harrington, which had designed the structure. City officials debated the advantages to both steel and concrete viaducts, and were eventually convinced by the consulting engineers to choose reinforced concrete.

The Kansas City Board of Public Works was principally responsible for the construction. John Lyle Harrington of Waddell and Harrington personally supervised both design and construction, while C.F. Graff, president of the Graff Construction Company gave his personal attention to the construction as well. An average of 200 men, of whom nearly 150 were carpenters, worked nine-hour days to erect the structure. Because the construction had been placed on a tight 15-month schedule, work often continued into the night. This was especially true of the pouring of concrete, a task that frequently stretched until midnight. Other aspects of the construction were frustrating: acquiring clean stone, and managing the costs of sand, steel and concrete.

The 2,054-foot long Twelfth Street Viaduct is a double-deck reinforced concrete bridge with girder spans supported by columns sunk in rock, soil, and concrete piles. A long arch span crosses eight railway tracks on Santa Fe Street. Because the columns are transversely paired, the upper deck cantilevers beyond each side of the columns, while the lower deck advances between them. The upper deck is

composed of forty-five deck girder spans of two girders each, which range in length from 33 to 56 feet. Included in the upper deck is the arch span and two earth filled approaches. The lower deck consists of twenty-seven through girder spans with two girders each. Cross girders and cantilevered beams support the floor slabs. Where both decks cross the street, shallow floors are needed, with concrete encased steel beams and concrete-covered steel girders serving as reinforcements. Both decks are lit by incandescent electric lights. "Careful attention was given to the architectural treatment in an effort to secure something more than a plain series of posts and beams," E.E. Howard stated. "The treatment developed considers the columns as columns with plinths and capitals, and not merely as posts. The bottoms of the upper-deck girders are curved to give an arched or high cambered appearance. The lower-deck girders are straight and in effect are supported by secondary pilasters set out from the main columns. Certain limiting conditions of the railway and street locations crossing under the structure practically determined certain column locations, but the span lengths were made smaller near the lower end of the structure, affording uniformity of appearance and preserving the unity of effect, in spite of the great variation in height of the different columns."

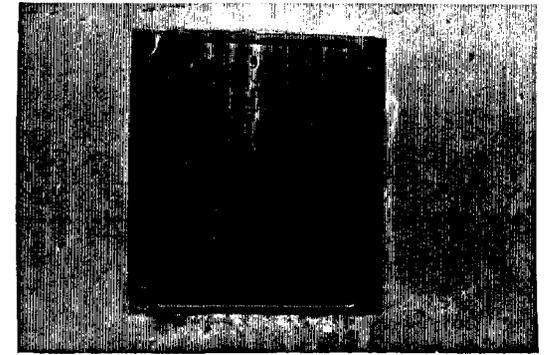

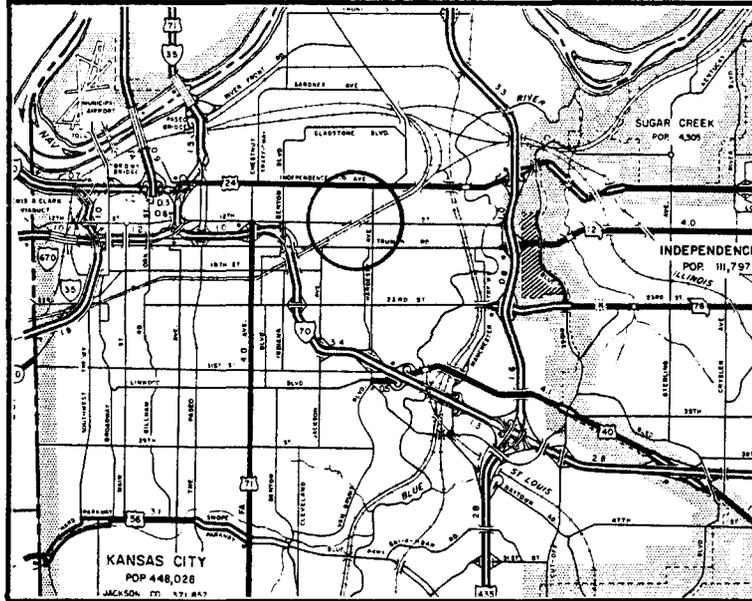

Completed in 1914 for the reported costs of \$577,330.49, the Twelfth Street Trafficway carried increasingly heavy vehicular and rail traffic for almost fifty years without major repair. In the mid-1960s, however, a major rehabilitation of the trafficway was undertaken, involving primarily deck reconstruction and replacement of the guardrails.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. The notable exception to this was in the large urban areas, where concrete's intrinsic rigidity under heavy vehicular and rail traffic offset its increased cost over steel. Several concrete viaducts and overpasses were built in Kansas City after the turn of the century, but none were larger than the Twelfth Street Trafficway. Considered a "bold departure in many respects from the established canons of design," this massive structure represents an extraordinary feat of civil engineering and construction management. The Twelfth Street Viaduct, according to one of its designers, "marks another important instance of the present tendency in American development to pass from the stage of pioneer civilization, with its temporary, but economical and expedient, types of buildings, works, ways, and systems, to an era of permanence, beauty of line and mass, sufficiency, and efficiency." The structure's double-deck configuration and through arch span are unique in Missouri and uncommon in the country. Given its importance to Kansas City transportation and its technological significance, the Twelfth Street Viaduct can be considered Missouri's foremost urban viaduct.

span number: 1
span length: 160.0'
total length: 163.0'
roadway wdt.: 41.0'

superstructure: steel, 7-panel, rigid-connected Pratt through truss, skewed
substructure: concrete (north), 2 concrete piers set in stone wall (south), concrete on top of both (bridge raised)
floor/decking: concrete deck over steel stringers
other features: upper chord / end post: box beam comprised of 4 angles with continuous plates and lacing; lower chord: box beam comprised of 4 angles with lacing; vertical: box beam comprised of 4 angles with double lacing; diagonal: box beam comprised of 4 angles with lacing or built-up I-beam comprised of 4 angles with lacing; strut: 4 angles with lacing; floor beam: I-beam, field-bolted to verticals; guardrail: 2 channels

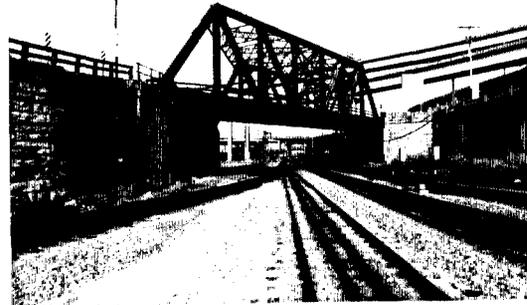

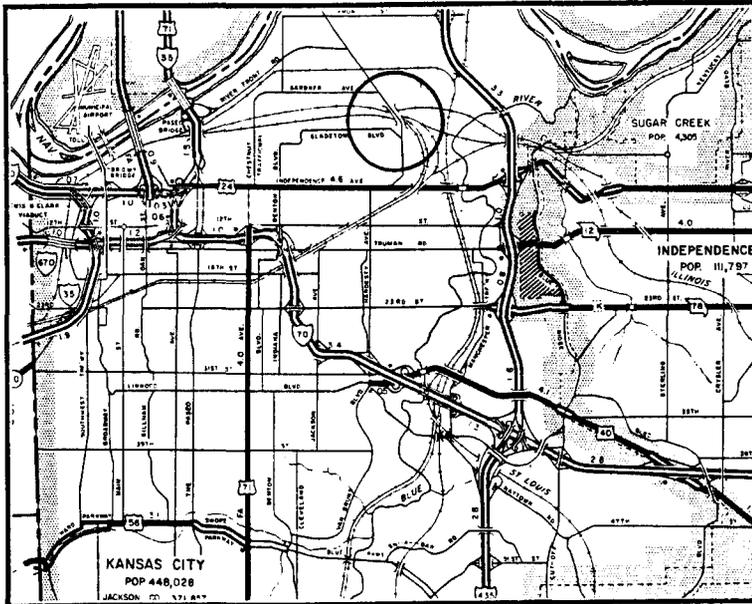

This heavily skewed, heavy-weight steel truss carries St. Louis Street over several railroad tracks in Kansas City. The overpass is comprised of a single Pratt through truss with riveted connections, supported by concrete/stone abutments. Locally known as the Bluff Street Bridge, this structure is the most recent in a series of overpass structures at this point. The crossing's history dates to at least 1873. That year a franchise was granted to a street railway company "causing street car tracks to be laid on each roadway of the Bridge over the Hannibal and St. Joseph Railroad," suggesting that a bridge had already been built here. In 1886 the Kansas City Bridge and Iron Company erected a superstructure to replace the existing bridge, operating under contract with the Corrigan Consolidated Street Railway Company. At that time the railway company hired Michael Walsh to extend one of the existing stone abutments. In 1893 the city and the Kansas City Metropolitan Street Railway Company entered into an agreement to fund a new viaduct here. Kansas City contractors Farnsworth and Blodgett received a contract that June to erect the new structure. In 1914-15 the viaduct was again rebuilt, this time by the Kansas City Terminal Railway Company. It is unclear during which incarnation of the bridge the stone/concrete abutment were built. The 1914-15 truss's function is indicated by its extremely heavy construction; it has historically carried both vehicular and interurban rail traffic. Today the Bluff Street Bridge is closed to traffic, and plans are underway for its replacement.

The Bluff Street Bridge is historically important for its longstanding role in Kansas City transportation. Historically it has been associated with some of the city's most important interurban railway companies, including the Corrigan Street Railway Company, the Metropolitan Street Railway Company and the Kansas City Terminal Railway Company. In its earliest form it ranked among the city's first grade separations. In its present form, it is technologically distinguished as among the earliest of the riveted Pratt trusses in the state. A singular-looking structure, it is a noteworthy transportation-related resource.

McELROY, CITY MANAGER / MATTHEW S. MURRAY, DIRECTOR OF PUBLIC WORKS / N.W. HYLAND, ASSISTANT DIRECTOR OF PUBLIC WORKS / EAST TWENTY-THIRD STREET VIADUCT / 1936 / BLACK & VEATCH CONSULTING ENGINEERS / WISCONSIN BRIDGE & IRON COMPANY CONTRACTOR

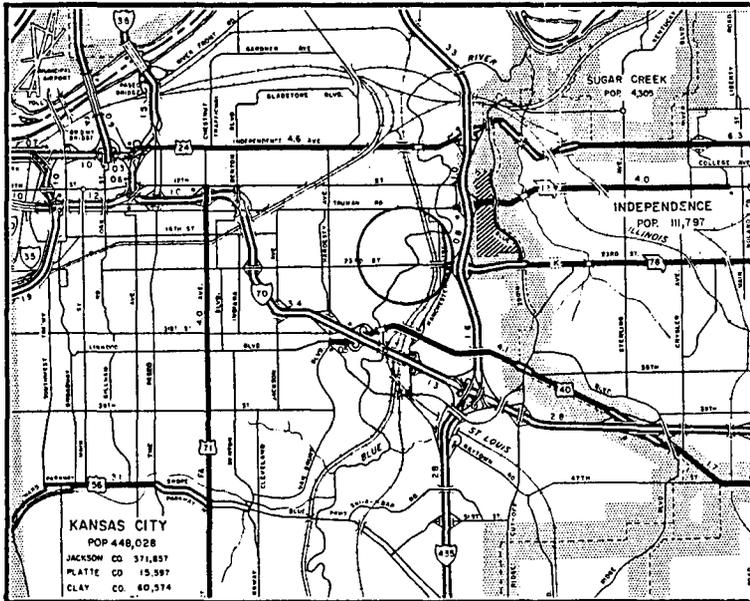

In 1935 Kansas City announced one of its civic improvement plans, which included "conquering the wilderness of the Blue Valley with Viaducts and Trafficways." For decades, the Blue River had been a major barrier to the development of the Blue Valley as well as the expansion of Kansas City. To combat this, the city constructed numerous bridges to carry the city's major thoroughfares across the river. Winner Road was completed, 15th Street and a bridge over the Blue were completed, and U.S. Highway 40 already crossed the Blue at both 31st and Leeds Streets. The Kansas City Department of Public Works contributed to this development by contracting for the construction of the East 23rd Street Viaduct, a 1,639-foot structure that intersected the Blue River and four rail tracks. Consulting engineers Black and Veatch designed the structure, a steel girder viaduct supported by concrete abutments. The Wisconsin Bridge and Iron Company fabricated and erected the structure, beginning work in 1936 and finishing in June 1938. Works Progress Administration men were employed along with state and city workers to construct the viaduct.

When completed in 1938 at a total cost of \$531,000, the viaduct formed a direct route between Independence Avenue and the south residential section of the city. City officials were thrilled with the viaduct, which "[made] the city accessible to suburban residents east of the Blue and between Fifteenth Street and U.S. Highway No. 40 cutoff." In addition, the East 23rd Street Viaduct "certainly will tend to stimulate the growth of the intercity area, and add to the value of the Blue Valley industrial sites." Today it is distinguished as one of the longest span steel beam bridges in Missouri. With its variable-depth plate girders and original guardrails and substructure, the East 23rd Street Viaduct is a noteworthy urban span.

An integral aspect of Kansas City's social and cultural development was the incorporation of a system of public parks and boulevards. first promoted in the late 19th century by prominent Kansas City personages such as August R. Meyer and designed by landscape architect George E. Kessler, the system featured a series of beautifully landscaped city parks linked with an "all-inclusive network of boulevards," which themselves were landscaped with plantings, sculptures, fountains and a variety of other decorative elements. Paseo Boulevard, or "the Paseo" as it is often called, formed a central spine that joined North Terrace Park on the north edge of Kansas City with Swope Park at the southern city limits. Extending from Admiral Boulevard to 79th Street for 9.07 miles, it was constructed between 1899 and 1919 and was actually a combined boulevard and parkway that ran north to south through the center of the city. The Paseo formed a focal point for Kessler's landscaping plan. As described by historian William Wilson:

The intersecting streets formed rectangles, each one of which Kessler fashioned into a distinctive park. At Ninth Street a small stone fountain bubbled; the Pergola, a double colonnade with a trellis roof, stood between Tenth and Eleventh; at Twelfth Kessler designed a high stone terrace to ornament and compensate for a steep grade; across Twelfth, a Spanish cannon captured during the Spanish-American War overlooked a formal sunken garden; at Fifteenth stood the wonder of the Paseo, an enormous stone fountain that Kessler designed after a fountain at Versailles. A small fountain at Eighteenth completed the original Paseo. Though each park was individual, all were harmonious and subordinated to the whole. In a day of slow travel, the Paseo presented a delightful pattern of colorful, shifting scenes to the pedestrian or carriage passenger.

As it extended through residential areas further south, the Paseo relied on the median between its north- and southbound lanes to form a long, essentially continuous park. Kessler used the overpass structures at intersecting streets—including this viaduct over Vine Street, one-half block east of the Paseo—to provide architectural punctuation for the boulevard. The 27th Street Viaduct was an integral feature in his plan. Engineered in 1916 by the Kansas City firm of Hedrick and Hedrick, the overpass employs graceful lines in its central open

Part of Kansas City's effort to "lift itself out of the mud" in the 1910s and 1920s included construction of the 23rd Street Viaduct. As designed by Harrington, Howard and Ash of Kansas City, the multiple-span structure was comprised of concrete deck girder spans with arched profiles, supported by concrete post-type piers. Built in 1919-21, the 23rd Street Viaduct dates to 1915. That year a \$300,000 bond issue was passed to build the viaduct and adjacent trafficway. After several delays, the Kansas City Board of Public Works finally signed an agreement in July 1917 with the Kansas City Railways Company and six other railroad companies to build the immense structure. The city would pay a third of the estimated \$600,000 cost, the Railways Company a third, and the six railroads the remainder. In March 1918 the city solicited competitive bids for the viaduct's construction, but the lowest bid—\$700,000 submitted by the Fuller Construction Company—was substantially above the initial estimates. With the nation in a world war, the city could not get the railroads to commit funds to the project. "I do not believe there is a ghost of a chance that the [federal] government will approve this project," Railways Company representative Phillip Kelly stated. "It is not one that will be considered essential. The government is permitting the railroads to spend money only for those things that will further the war."

Without the railroads' support, the city was forced to reject Fuller's bid and shelve the project until the war's end. By the time the city let the contract to build the viaduct in March 1919 to low-bidder A.S. Hecker of Cleveland, the cost had risen to \$750,000. Although approved unanimously approved by the Kansas City Board of Public Works and the mayor, the contract was first rejected by the city council, largely due to the opposition by the Pendergast interests, which objected to the out-of-town contractor. "I know nothing of conditions in Kansas City," Hecker admitted to the council. "When the contract was awarded by the board of public works I went back home and when I got word the lower house [of city council] had rejected the contract, nearly all of our equipment, worth about \$50,000 and a lot of it new, was loaded on cars and ready to ship. I had given the board my word that I would be on the job and ready to go to work within two weeks after the contract was confirmed. I was making ready to keep that promise."

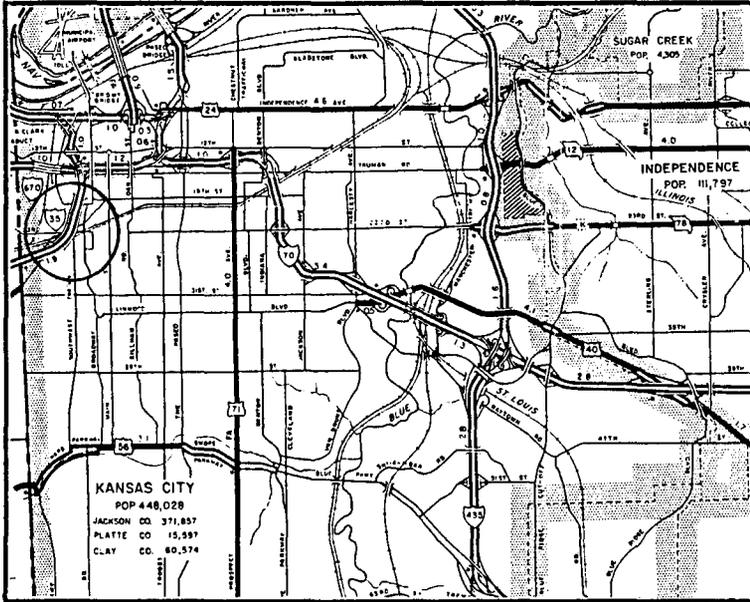

The council eventually approved Hecker's contract, and he began work on the viaduct in 1919. During construction, a "temporary dangerous and unsafe wooden bridge" was used until the structure was completed. The viaduct's price was increased again as it was

nearing completion in 1921, this time to \$900,000. When the structure was finished that year, its aggregate cost was slightly less than \$1 million. "The faith and civic spirit in Armourdale which held its people there despite overflows of the Kaw River was again manifest yesterday when despite lowering clouds during the afternoon, the committee in charge of the Twenty-third street viaduct opening kept at work on the preparations," the **Kansas City Journal** reported in September. "And it was faith and civic spirit that made possible the great structure, faith and determination through the years of delays." Held on September 21, 1921, the grand opening of the viaduct was attended by Missouri Governor Henry Allen and Kansas City officials, who all gave speeches congratulating each other for their remarkable foresight in building the structure. Once opened, the 23rd Street Viaduct carried vehicular traffic in essentially unaltered condition for about 40 years. In 1960 it was widened, the deck and guardrails replaced and steel girder spans added.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. The 23rd Street Viaduct is distinguished among these as one of the most massive of Missouri's early concrete bridges. Its subsequent alterations have diminished the structure's interpretive value, however.

total length:	74.0'	floor/decking:	concrete deck
roadway wdt.:	42.5'	other features:	steel angle guardrails; decorative bronze plates mounted on concrete guardrail bulkheads

This medium-scale concrete bridge carries Troost Avenue over Brush Creek in central Kansas City. The first bridge here was built in 1904. By 1916, this structure was in need of replacement, however, and that September the Kansas City Board of Public Works moved to replace the existing structure with a more massive concrete bridge. As designed, the new Troost Avenue Bridge consisted of a single open spandrel arch, supported on a skew by concrete abutments. On September 29, 1916, the board contracted with the Fox Redpath Construction Company to build the bridge, appropriating \$17,000.00 from the Bridge and Viaduct Fund for its construction. Fox Redpath finished work on the bridge the next year. Total Cost: \$19,578.97. Since its completion the Troost Avenue Bridge has carried vehicular traffic. In 1977 its deck and guardrails were replaced, altering the structure's appearance somewhat.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. Of the more than 13,000 pre-1951 bridges identified in Missouri by the statewide historic bridge inventory, only about three dozen are open spandrel concrete arches. The Troost Avenue Bridge is distinguished among these for its relatively early construction.

Between 1910 and 1920, Kansas City's population increased by 30 percent and the automobile became a more popular mode of transportation. Along with these changes emerged the need for wider streets and other road improvements. Using a tax bill method for funding, the Chamber of Commerce launched the "Get-It-Done" movement in 1921, which initiated and completed numerous municipal improvement projects. Among these was the Sebree Bridge, a concrete open spandrel arch that crossed Brush Creek connecting the Swope Parkway with Benton Boulevard. "The vast importance of this project," reported the **Kansas City Star** in January 1922, "is that eastern and Northeastern Kansas City will be linked directly with Swope Park."

The city hired Harrington, Howard and Ash to engineer the proposed bridge in 1921 and the following January let the contract to build the Sebree Bridge. Completed in 1923, the Sebree Bridge featured three 80-foot spans, with a series of five arched deck girder approach spans. By 1924, even though most of its initial "Get-It-Done" projects had been completed, city officials realized that tax bills were not sufficient to complete the scope of projects planned. By the 1930s, a system of bond bills was suggested to replace tax bills. Nevertheless, the "Get-It-Done" program inspired city officials to come up with a more comprehensive program of public improvements within a specific time frame. The Sebree Bridge functioned unaltered until 1983, when it was rehabilitated. It is today distinguished as a well-preserved example of monumental urban bridge construction. With its three long arches and five shorter arched girder spans, the Sebree Bridge was characterized by the **Kansas City Journal** as "one of Kansas City's most artistic bridges."

other features: steel guardrail, solid concrete balustrade separates sidewalks from traffic, chain link fence on outside of sidewalks

As part of the effort to create jobs during the Depression, Congress in 1934 passed an act allowing federal monies to be used for road and bridge construction within municipalities. Taking advantage of the new legislation, the Missouri State Highway Commission undertook a number of urban road and bridge projects in subsequent years. Between 1934 and 1936, 558 new structures were designed by MSHD. Located over the Big Blue River in Kansas City, the Blue Parkway Viaduct was one of these. To span the river as well as tracks of the St. Louis & San Francisco Railroad, the highway department in 1935 engineered a series of fourteen steel plate deck girder spans, supported by concrete spill-through piers. This span was one of six such vehicular bridges built over the Blue in 1936. It was erected that year by the List Construction Company for a total cost of \$197,322.48. Since its completion, the Blue Parkway Viaduct has functioned in place, with a rehabilitation in 1976 as its most serious alteration.

As an important crossing of the Big Blue River and the St. Louis & San Francisco Railroad, the Blue Parkway Viaduct has formed an integral part of the city's street system. The viaduct is also important as one of the railroad separation projects funded through the New Deal's Hayden-Cartwright Act. Federal relief programs of the 1930s broke with past practice by allowing federal funds to be used for urban, as well as rural highways. Grade separation was a major focus of the highway department during this period, requiring commitment of much staff time. The Blue Parkway Viaduct is technologically distinguished as one of the longest-span examples of its type. Through the 1930s and 1940s, the Missouri State Highway Department designed and built progressively longer steel beam bridges, using both rolled and plate girders in through and deck configurations. This culminated at the end of the decade with spans around 150 feet. Other longer girders had been built elsewhere in the country, but for Missouri, this represented a noteworthy technological feat. With its 105-foot deck girder span and 1936 construction date, the Blue Parkway Viaduct is noteworthy as one of the earliest of these long-span beam bridges.

roadway wdt.: 30.5'

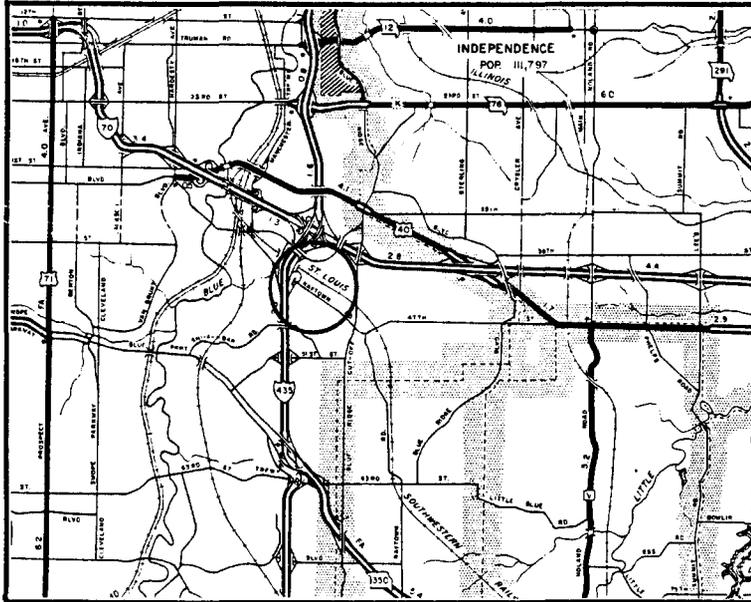

other features: concrete guardrails with recessed rectangular panels

This small-scale concrete bridge carries the Raytown Road over Round Grove Creek in Kansas City. The Raytown Road Bridge consists of a filled spandrel arch with an elliptical profile, supported by concrete abutments and featuring solid concrete guardrails with recessed rectangular panels. The Raytown Road Bridge dates to 1912. In April of that year the Jackson County Court solicited competitive bids for four concrete bridges in this part of the county. Proposals were received for the bridges in May and taken under advisement. The county later contracted with the Mulholland Construction Company for the structures. This small arch was completed the next year. It has functioned in place since, with essentially no alteration.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. Built in 1913, the Raytown Road Bridge is noteworthy as an early, well-preserved example of concrete bridge construction in Missouri.

other features: concrete balustrade posts; bridge plate at each end: **MISSOURI HIGHWAY DEPT BRIDGE No. K607 1936**

During the 1930s, Kansas City launched its Ten-Year Plan, a program of civic improvements funded by city bond elections. Throughout that decade the Civic Improvement committee appropriated funds each year for a variety of projects, including road and bridge construction. In 1935, the **Kansas City Times** stated that an important aspect of the Ten-Year Plan was the "subjugation of the Blue River Valley" which was "buttressed by wooded, irregular hills, has stayed the developer, shunning the city's growth and the platting of home districts southward, even far beyond Brush Creek." By 1934, the Civic Improvement committee approved \$150,000 "for the purchase of rights of way for bridges over Blue river at Twenty-third, Thirty-ninth, and Sixty-third Streets..." Each of these provided links between some of the city's major trafficways and state or county roads. According to the **Times**, "Sixty-third Street represents another east-west gap soon to be plunged with viaduct and concrete slab." The 63rd Street Viaduct was designed by the Missouri State Highway Department, its steel fabricated by the Illinois Steel Company of Chicago, and its construction undertaken by the W.A. Ross Construction company for a total cost of \$357,989. It is a steel girder viaduct supported by concrete abutments. Decorative concrete columns are featured at each corner of the structure. Ultimately, it ran from the northern edge of Swope Park to with the county highway. When completed, the structure linked the network of Jackson County highways to the Raytown region, united with U.S. Highway 50, and made accessible by car lands in the Blue Valley.

Through the 1930s and 1940s, the Missouri State Highway Department designed and built progressively longer steel beam bridges, using both rolled and plate girders in through and deck configurations. This culminated at the end of the decade with spans around 150 feet. Other longer girders had been built elsewhere in the country, but for Missouri, this represented a noteworthy technological feat. With its 140-foot deck girder spans, the 63rd Street Viaduct in Kansas City is distinguished as one of the longest beam bridges identified in the statewide inventory. Although built late in the milieu of bridge construction in Missouri, it is significant as the ultimate extension in the state of this utilitarian structural type.

An integral aspect of Kansas City's social and cultural development was the incorporation of a system of public parks and boulevards. first promoted in the late 19th century by prominent Kansas City personages such as August R. Meyer and designed by landscape architect George E. Kessler, the system featured a series of beautifully landscaped city parks linked with an "all-inclusive network of boulevards," which themselves were landscaped with plantings, sculptures, fountains and a variety of other decorative elements. Paseo Boulevard, or "the Paseo" as it is often called, formed a central spine that joined North Terrace Park on the north edge of Kansas City with Swope Park at the southern city limits. Extending from Admiral Boulevard to 79th Street for 9.07 miles, it was constructed between 1899 and 1919 and was actually a combined boulevard and parkway that ran north to south through the center of the city. The Paseo formed a focal point for Kessler's landscaping plan. As described by historian William Wilson:

The intersecting streets formed rectangles, each one of which Kessler fashioned into a distinctive park. At Ninth Street a small stone fountain bubbled; the Pergola, a double colonnade with a trellis roof, stood between Tenth and Eleventh; at Twelfth Kessler designed a high stone terrace to ornament and compensate for a steep grade; across Twelfth, a Spanish cannon captured during the Spanish-American War overlooked a formal sunken garden; at Fifteenth stood the wonder of the Paseo, an enormous stone fountain that Kessler designed after a fountain at Versailles. A small fountain at Eighteenth completed the original Paseo. Though each park was individual, all were harmonious and subordinated to the whole. In a day of slow travel, the Paseo presented a delightful pattern of colorful, shifting scenes to the pedestrian or carriage passenger.

As it extended through residential areas further south, the Paseo relied on the median between its north- and southbound lanes to form a long, essentially continuous park. Kessler used the overpass structures at intersecting streets to provide architectural punctuation for

An integral aspect of Kansas City's social and cultural development was the incorporation of a system of public parks and boulevards. first promoted in the late 19th century by prominent Kansas City personages such as August R. Meyer and designed by landscape architect George E. Kessler, the system featured a series of beautifully landscaped city parks linked with an "all-inclusive network of boulevards," which themselves were landscaped with plantings, sculptures, fountains and a variety of other decorative elements. Paseo Boulevard, or "the Paseo" as it is often called, formed a central spine that joined North Terrace Park on the north edge of Kansas City with Swope Park at the southern city limits. Extending from Admiral Boulevard to 79th Street for 9.07 miles, it was constructed between 1899 and 1919 and was actually a combined boulevard and parkway that ran north to south through the center of the city. The Paseo formed the focal point for Kessler's landscaping plan. As described by historian William Wilson:

The intersecting streets formed rectangles, each one of which Kessler fashioned into a distinctive park. At Ninth Street a small stone fountain bubbled; the Pergola, a double colonnade with a trellis roof, stood between Tenth and Eleventh; at Twelfth Kessler designed a high stone terrace to ornament and compensate for a steep grade; across Twelfth, a Spanish cannon captured during the Spanish-American War overlooked a formal sunken garden; at Fifteenth stood the wonder of the Paseo, an enormous stone fountain that Kessler designed after a fountain at Versailles. A small fountain at Eighteenth completed the original Paseo. Though each park was individual, all were harmonious and subordinated to the whole. In a day of slow travel, the Paseo presented a delightful pattern of colorful, shifting scenes to the pedestrian or carriage passenger.

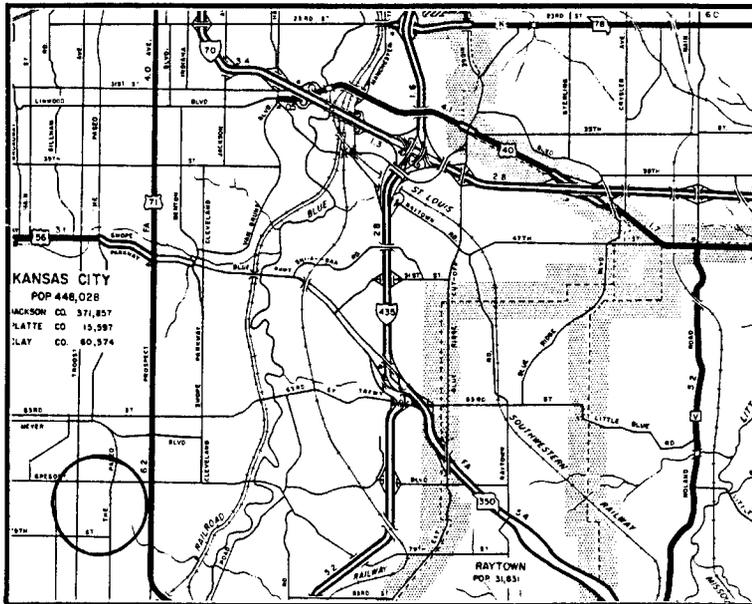

As it extended through residential areas further south, the Paseo relied on the median between its north- and southbound lanes to form a long, essentially continuous park. Kessler used the overpass structures at intersecting streets to provide architectural punctuation for

the boulevard. The twin overpasses that carried the Paseo over 77th Street were integral features in Kessler's grand scheme. Engineered by the pre-eminent Kansas City firm of Harrington, Howard and Ash, the Paseo Overpasses employ forceful lines and ornamental concrete work to create a handsome landscaping feature for the boulevard. They replaced a timber bent trestle that had been built by the Metropolitan Street Railway Company in 1907. In October 1915 the Board of Park Commissioners let a contract to grade the Paseo to H.H. Hannenkratt. The contract included construction of the overpasses to carry the Paseo over 77th Street, for which Hannenkratt subcontracted with D. Munro. The two Paseo Overpasses were completed in 1917 for an aggregate cost of about \$70,000 as the boulevard was in its final stages of construction. Since their completion, the Paseo Overpasses have carried traffic with no substantial alteration.

Kansas City's network of parks and boulevards represents one of the most stellar successes of the City Beautiful Movement in America. "These boulevards and their east-west links tied not just the parks but the entire city together," according to Wilson. Costing \$14.7 million dollars by 1915, the system by 1920 incorporated almost 2000 acres of parkland and 90 miles of scenic boulevards. As the main link through the heart of the city, the Paseo was an integral feature in this boulevard system. It not only provided a vital greenbelt to link the parks, but it afforded George Kessler an extended pallet over which he could develop his grandiose concept of landscape design. Although its elaborate fountains were derided by some, Kessler's Paseo was an aesthetic success—one of Missouri's most noteworthy examples of urban landscaping. As integral components of the Paseo, these two overpasses are significant for their contribution to its architectural success.

total length: 40.0'	floor/decking: asphalt over earth fill
roadway wdt.: 20.0'	other features: concrete guardrails with rectangular slots

Located just east of the Hillcrest Country Club, this small concrete bridge carries Hillcrest Road over a small creek. Built in 1906, when the Kansas City Board of Park Commissioners endeavored to establish a system of parks connected by scenic boulevards, the Hillcrest Road Bridge was most likely an attempt to develop the roads in the municipal parks. Hillcrest Road connects with Oldham Road in Swope Park. A concrete filled spandrel arch supported by concrete abutments and pier, this structure was built in 1906, probably by the Midland Bridge Company of Kansas City. The Hillcrest Road Bridge has since functioned in place with only minor modification.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. The Hillcrest Road Bridge is distinguished among these as one of earliest dateable examples of concrete arch construction in the state. Modestly scaled and simply detailed, it is noteworthy as an early, well-preserved example of concrete bridge construction in Missouri.

substructure: concrete abutments, wingwalls and spill-through piers
floor/decking: concrete deck over steel stringers
other features: concrete post-and-rail guardrails

During World War II, the Missouri State Highway Department's Bureau of Bridges underwent an enormous transformation. Due to wartime shortages on building materials, such as steel, the numbers of bridges designed and constructed during those years plummeted. Those bridges that were constructed were composed of "as few critical materials as possible," including unreinforced concrete, timber and salvaged steel. The Troost Avenue Viaduct was built in 1943, during the country's second year at war. The structure was designed by the Missouri State Highway Department. The construction contract of \$115,664.00 was awarded to List and Weatherly Construction Company of Kansas City. A steel stringer viaduct, its steel I-beams, splice plates, and bearing plates were acquired by the Public Roads Administration through the Salvage Section of the War Production Board. As designed by MSHD, ten I-beam spans ranging from 24 feet to 65 feet are supported by open concrete bents. The Troost Avenue Viaduct extends from Troost Avenue over 85th Street, railroad tracks, and a tributary of the Blue River. Work on the structure began in February 1943 and was completed in June of that year. Carrying traffic in essentially unaltered condition since its completion, this bridge represents the way in which the Bureau of Bridges weathered the problems associated with wartime shortages.

span number: 1	superstructure: concrete rigid frame
span length: 37.0'	substructure: concrete abutments and wingwalls
total length: 38.0'	floor/decking: concrete deck
roadway wdt.: 20.5'	other features: recessed panels on concrete spandrel walls; fluted Art Moderne pylons at abutments; Armco guardrails

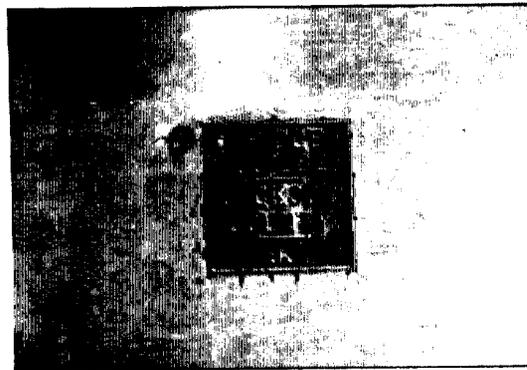

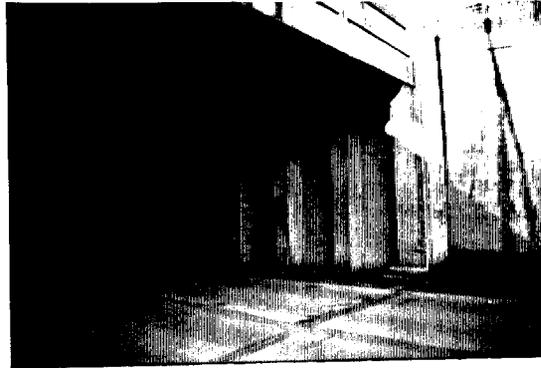

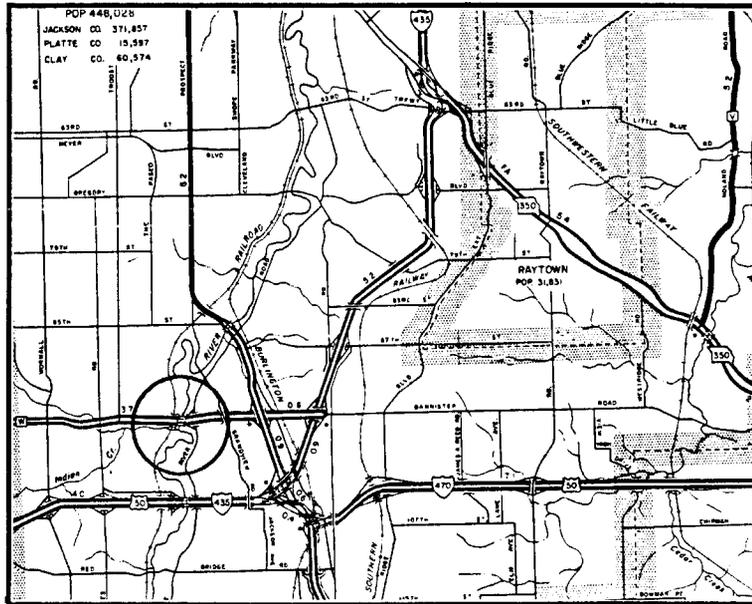

In the early 1930s, with Harry Truman as the Presiding Judge, the Jackson County Court issued \$10 million in bonds to fund a massive road and bridge campaign. Under this, miles of roads were built or improved and numerous bridges and overpasses built. These latter structures employed a variety of structural types, including steel trusses, steel stringers, concrete girders, concrete slabs and concrete arches. One bridge—the Banister Road Overpass—used a novel, relatively new structural type: the concrete rigid frame. This small-scale structure featured a single 37-foot span, with a series of straight concrete girders tied rigidly to engaged concrete columns on the abutments. With earth-overburden deck, the Bannister Road Overpass resembled a large concrete box culvert, which was its closest structural analogy. Built in 1931, it has functioned in place since, with its superstructure essentially intact and the more recent construction of Armco guardrails as its only alteration.

Developed by Westchester County, New York, in the early 1920s, the concrete rigid frame bridge became especially popular for federal relief projects during the 1930s. Both picturesque and practical, the flat or elliptically arched designs appealed to proponents of urban beautification. Neither the municipalities nor the state highway department of Missouri used the rigid frame configuration extensively. In fact, only three concrete rigid frame bridges have been identified by the statewide bridge inventory, all of which are in Kansas City. Built relatively early in the milieu of rigid frame construction, the Bannister Road Overpass is distinguished by its well-preserved condition. It is technologically significant as a relatively rare example of what was essentially an experimental structural type in Missouri.

span number: 1
span length: 70.0'
total length: 86.0'
roadway wdt.: 56.4'

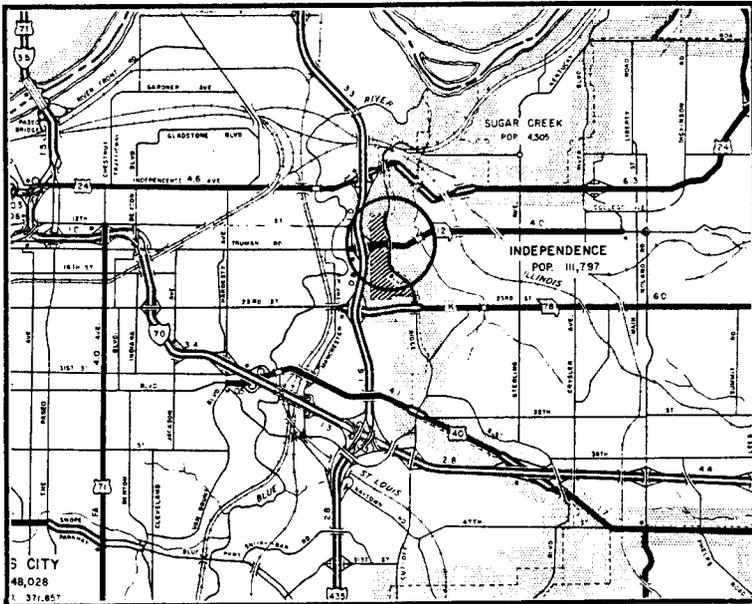

superstructure: stone filled spandrel arch
substructure: stone masonry abutments and wingwalls
floor/decking: asphalt over earth fill
other features: ashlar stone masonry on spandrels, wingwalls, guardrails and arch barrel; concrete stringcourse with stone corbels on spandrel; builder's plate: **BUILT BY FORRESTER-SWENSON CONSTRUCTION CO. / OSCAR KOELHER**

This handsomely proportioned structure carries the Blue Ridge Boulevard over Missouri State Highway 12 in Blue Summit. The overpass is configured as an elliptical stone masonry arch, with limestone ashlar used for the arch spandrels, barrel, wingwalls and guardrails. Architectural expression on the overpass consists of decorative stone guardrails and a concrete stringcourse with stone corbels on each of the spandrels. The Blue Ridge Boulevard Overpass dates to 1906. That year Jackson County Surveyor Oscar Koehler designed this structure to carry the Blue Ridge Boulevard over Blue Avenue (15th Street) "on the main rock road between Kansas City and Independence." This was the largest of several stone arch bridges of various descriptions that Koehler had designed. The overpass, according to Koehler, "commands a grand view of the eastern part of Kansas City and the beautiful Blue River Valley, including fine rolling country thereabout, with the City of Independence in the distance." It was built that year by the Forrester-Swenson Construction Company. Since its completion, the Blue Ridge Overpass has carried vehicular traffic, without serious alteration.

"This is the longest single span rubble masonry arch bridge that has been constructed in the western country, and has been greatly admired by all who have had an opportunity to view it," Koehler stated in October 1908. He was proud of the Blue Ridge Overpass, featuring it prominently in a campaign brochure entitled "Good Roads and Safe Bridges." Indeed the Blue Ridge Overpass stands out among the stone arch bridges built in Missouri. It is today the oldest dateable stone bridge and by far the longest-span stone structure found in the state. It features the most successful architectural treatment in a group of relatively plain-faced stone arches remaining in Missouri. And it is one of the best preserved of Missouri's remaining stone bridges. All of Koehler's lesser known arch bridges have since been demolished. The Blue Ridge Overpass today stands as the most noteworthy of Missouri's stone arch bridges.

span number:	1	superstructure:	concrete filled spandrel arch
span length:	40.0'	substructure:	concrete abutments and wingwalls
total length:	42.0'	floor/decking:	earth fill over concrete
roadway wdt.:	17.5'	other features:	concrete guardrails with rectangular incised panels

This single-span concrete bridge carries a county road over a branch of the Little Blue River in south-central Jackson County. The structure features a filled spandrel concrete arch with an elliptical profile supported by concrete mass abutments. It is simply detailed, with incised rectangular panels on the guardrails as the only architectural expression. The Little Blue River Bridge dates to 1911. On June 1st of that year the Jackson County Court received bids for two concrete structures: a 70-foot arch over Sni-A-Bar Creek and a 40-foot arch over the East Fork of the Little Blue River. The contract to build them was awarded to the Midland Bridge Company of Kansas City for \$8600.00. Completed in October for a cost of \$2648.00, the Little Blue River Bridge has since functioned in place, with the partial replacement of part of one collision-damaged guardrail as the only alteration of note.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. The Little Blue River Bridge is distinguished among these as one of the oldest remaining concrete arch bridges found in the state. Modestly scaled and simply detailed, it is noteworthy as an early, well-preserved example of concrete bridge construction in Missouri.

The floods that struck Johnson County late in 1928 were some of the worst in memory. Up to ten inches of rain fell over the region between November 15th and 17th, sending water roaring down Big Creek and its tributaries. "Starting late Thursday night, rain fell continuously in torrential quantity until 8 o'clock Saturday morning when it began to slacken," a local newspaper reported, "and during the rest of the morning only a light mist fell. As a result practically all streams in this vicinity are out of their banks, lowlands are flooded and roads and highways have been made impassable." No human lives were lost, but damage to livestock, crops and property was extensive. Flood stage at Quick City was six feet higher than the previous high water mark, heavily damaging several houses in the small town. And farmers such as Byron Riffle and C.L. Farnsworth, who had cattle in low-lying pastures, lost much of their herds when cows floated away in the roiling water. One of Farnsworth's animals was later found dead in a tree.

For the Johnson County Court, the damage was particularly acute, as some fifteen county-owned bridges were wrecked by the floodwaters, aggregating between \$60,000 and \$75,000 of loss. "Small bridges and culverts by the score over the county will have to be rebuilt," another newspaper reported. "The county engineer says that several bridges repaired the last year by bridge crews were lost in the onslaught of the waters and trees carried along in the flood." In the aftermath of the flood, Johnson County re-built or moved several steel and iron trusses, including this long-span pinned Parker through truss northeast of Warrensburg. In 1929 the Johnson County Court contracted with the Standard Bridge Company to supply and erect five long-span steel trusses. Standard's bid was substantially lower than those of the other six firms that had bid, primarily because the Omaha-based firm was proposing to use pin-connected trusses. Although the 200-foot span of the Blackwater River Bridge was far longer than the crossing required, its extreme length served to insure that the structure would never be washed away again.

Standard used steel rolled by Bethlehem to fabricate the truss. For the truss's design, the firm used an established configuration—the Parker through truss. Developed in the 19th century by C.H. Parker, the Parker truss was characterized by upper chords and vertical members that acted in compression and lower chords and diagonals acting in tension. In this it resembled the venerable Pratt and was, in fact, universally regarded by civil engineers as a Pratt subtype. J.A.L. Waddell in his influential Bridge Engineering gave the Parker only passing mention in his discussion of truss types, stating: "[The Pratt's] chords are not necessarily parallel, but may be inclined. This latter form is frequently known as the Parker truss." The inclined upper chords afforded a degree of efficiency in long span trusses, where bending moment stresses at mid-span greatly exceed the shear stresses at the ends. The Parker's drawback was that, unlike the straight-chorded Pratt truss, the polygonal chords necessitated different-length verticals and diagonals at each panel, increasing its fabrication costs somewhat. Because trusses were generally priced on the basis of their superstructural steel weight, the lighter overall weight of a polygonal-chord truss more than offset the slight increase in fabricating costs in spans greater than 160 feet. In the highly competitive bridge industry, this economy equated directly with profit.

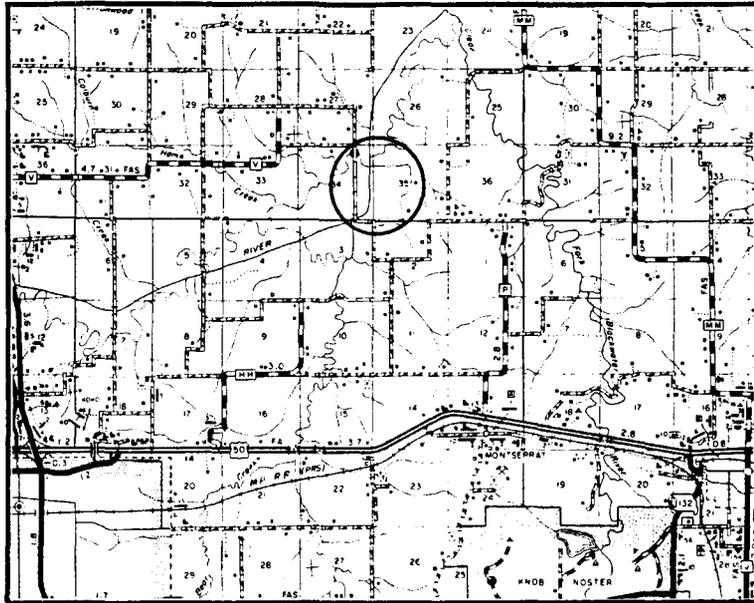

Standard probably completed the Blackwater River Bridge in 1929; since that time the bridge has functioned in place, with only maintenance-related repairs.

Built as an emergency measure in the wake of severe flooding, the Blackwater River Bridge is one of the few pin-connected Parker trusses remaining in use on Missouri's roadways. Thousands of pinned trusses were built across the state during an intense period of bridge construction in the late 19th and early 20th centuries. Most featured straight-chorded Pratt configurations. After the turn of the century, however, bridge manufacturers found a greater economy in polygonal-chorded Pratt variants (particularly the Parker truss) for long-span applications. Among these, the Blackwater River Bridge is noteworthy for its long span. With its pinned configuration, it is not unique among Missouri's early roadway spans. Rather, the significance of this structure accrues from its representation of early wagon/auto bridge construction. It is among the longest and best-preserved trusses in Missouri: an important example of a now-uncommon structural type.

Known locally as the Waupler Bridge, this single-span truss carries a gravel-surfaced county road over the Clear Fork of the Blackwater River northeast of Warrensburg. The structure consists of a pin-connected Pratt through truss, supported by concrete/stone abutments. Johnson County bridge files noted in 1903 that the Waupler Bridge was a "steel bridge built some time ago." Physical attributes of the truss indicate that it was fabricated around 1890. Today the bridge is closed to traffic, with its timber deck removed.

In the early 1880s the pin-connected Pratt through truss superseded the bowstring arch-truss as the iron bridge of choice for medium- and long-span wagon bridges. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design is distinguished by vertical members acting in compression and diagonals that act in tension. "The Pratt truss is the type most commonly used in America for spans under two hundred and fifty (250) feet in length," noted bridge engineer J.A.L. Waddell wrote in 1916. "Its advantages are simplicity, economy of metal, and suitability for connecting to the floor and lateral systems." Virtually all of the major regional bridge fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties in the late 19th and early 20th centuries. Hundreds of Pratts remain in place today. The Waupler Bridge is distinguished among these for its early construction date. It is thus noteworthy as an early example in Missouri of a mainstay structural type: the pin-connected Pratt through truss.

For the Johnson County Court, the damage was particularly acute, as some fifteen county-owned bridges were wrecked by the floodwaters, aggregating between \$60,000 and \$75,000 of loss. "Small bridges and culverts by the score over the county will have to be rebuilt," another newspaper reported. "The county engineer says that several bridges repaired the last year by bridge crews were lost in the onslaught of the waters and trees carried along in the flood." In the aftermath of the flood, Johnson County re-built or moved several steel and iron trusses, including this medium-span pinned Pratt through truss northeast of Warrensburg. Originally erected here around 1895, the span was dismantled and moved by the county from the "old channel of Blackwater Creek" to the Granger Ford. On July 1, 1929, the county court hired the Standard Bridge Company of Omaha to build new piers and abutments and re-erect the bridge at its new location for \$1,563.00. Since that time, the Granger Ford Bridge has functioned in place, with the partial reconstruction of its substructure and the addition of approach spans as the most noteworthy alterations to date.

In the early 1880s the pin-connected Pratt through truss superseded the bowstring arch-truss as the iron bridge of choice for medium- and long-span wagon bridges. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design is distinguished by vertical members acting in compression and diagonals that act in tension. "The Pratt truss is the type most commonly used in America for spans under two hundred and fifty (250) feet in length," noted bridge engineer J.A.L. Waddell wrote in 1916. "Its advantages are simplicity, economy of metal, and suitability for connecting to the floor and lateral systems." Virtually all of the major regional bridge fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties in the late 19th and early 20th centuries. Hundreds of Pratts remain in place today. The Granger Ford Bridge is a typically configured example of this statewide bridge trend.

--	--

Located in west-central Johnson County northeast of Holden, this short-span truss carries a secondary county road over Little Blackwater Creek. The structure consists of a single pinned Pratt through truss, supported by stone abutments, that have been extended and repaired with sections of concrete. Known locally as the Murray Ford Bridge, the truss dates to 1890. In September of that year the Johnson County Court directed the county road and bridge commissioner to solicit competitive bids for an iron bridge across the Blackwater at the Murray Ford, on the Holden-Columbus Road, and another small-scale structure near Leeton. The county later contracted with John Bridgewater, a local builder responsible for constructing the majority of the timber and combination spans in Johnson County in the 1880s and early 1890s. Bridgewater completed the stone substructure by the following spring, but finished the iron superstructure only after the county threatened to cancel the contract in June 1891. The truss's fabricator is unrecorded. Since its completion, presumably later that year, the Murray Ford Bridge has carried county-road traffic. The structure has more recently been bypassed by an adjacent crossing of Blackwater Creek, although it is still open for traffic, in essentially unaltered condition.

In the early 1880s the pin-connected Pratt through truss superseded the bowstring arch-truss as the iron bridge of choice for medium- and long-span wagon bridges. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design is distinguished by vertical members acting in compression and diagonals that act in tension. "The Pratt truss is the type most commonly used in America for spans under two hundred and fifty (250) feet in length," noted bridge engineer J.A.L. Waddell wrote in 1916. "Its advantages are simplicity, economy of metal, and suitability for connecting to the floor and lateral systems." Virtually all of the major regional bridge fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties in the late 19th and early 20th centuries. Hundreds of Pratts remain in place today. The Murray Ford Bridge is distinguished among these for its relatively well-preserved condition and for its early construction date. It is thus significant as an early and well-preserved example—the oldest remaining, originally placed span in Johnson County—of a mainstay structural type: the pin-connected Pratt through truss.

substructure: steel pile abutments with concrete back- and wingwalls
floor/decking: timber deck over steel stringers
other features: upper chord and inclined end post: 2 channels with cover and batten plates; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing; diagonal: 2 punched rectangular eyebars; lateral bracing: round rod with threaded ends; counter: round rod with turnbuckle; strut: 2 angles; floor beam: I-beam, U-bolted to verticals; guardrail: steel channels

The floods that struck Johnson County late in 1928 were some of the worst in memory. Up to ten inches of rain fell over the region between November 15th and 17th, sending water roaring down Big Creek and its tributaries. "Starting late Thursday night, rain fell continuously in torrential quantity until 8 o'clock Saturday morning when it began to slacken," a local newspaper reported, "and during the rest of the morning only a light mist fell. As a result practically all streams in this vicinity are out of their banks, lowlands are flooded and roads and highways have been made impassable." No human lives were lost, but damage to livestock, crops and property was extensive. Flood stage at Quick City was six feet higher than the previous high water mark, heavily damaging several houses in the small town. And farmers such as Byron Riffle and C.L. Farnsworth, who had cattle in low-lying pastures, lost much of their herds when cows floated away in the roiling water. One of Farnsworth's animals was later found dead in a tree.

For the Johnson County Court, the damage was particularly acute, as some fifteen county-owned bridges were wrecked by the floodwaters, aggregating between \$60,000 and \$75,000 of loss. "Small bridges and culverts by the score over the county will have to be rebuilt," another newspaper reported. "The county engineer says that several bridges repaired the last year by bridge crews were lost in the onslaught of the waters and trees carried along in the flood." Six of the largest structures wrecked by the flooding spanned Big Creek. One of these was the truss north of La Tour, among the county's oldest bridges: "The truss was carried about 200 yards distant, while the flooring was found three-quarters of a mile distant." But the largest structure washed away by the floodwaters that fall was the steel span over Big Creek on the outskirts of Quick City.

The Quick City Bridge was beyond salvation. The substructure was badly twisted, and the county court decided that the truss's 75-foot span was insufficient for this crossing. Instead of re-building the bridge in its original position, the judges opted to replace it entirely. The 1912 truss would be recovered from the stream and moved to another location, and a new, longer truss would be built in its place. In January the court declared an emergency and ordered Presiding Judge J.S. Graham to purchase a replacement structure from the Standard Bridge Company of Omaha, Nebraska. The court must have had a change of mind, when, the following month, it ordered county highway engineer L.E. Quick to solicit competitive bids for the Quick City Bridge and another span over the Blackwater Ditch. Late in February proposals were received from seven bridge companies. At \$10,760.00, the Standard's bid was substantially lower than those of the other six firms. The primary reason that Standard's proposal was so much lower than the others was that the Omaha-based firm was proposing to use pin-connected trusses. Although the 200-foot span of the Quick City Bridge was far longer than the crossing required, its extreme length served to insure that the structure would never be washed away again.

The truss that Standard fabricated for the Quick City crossing featured a Pratt configuration - the most common vehicular truss type in the country. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design was characterized by upper chords and vertical members acting in compression and lower chords and diagonals that acted in tension. Its parallel chords and equal panel lengths resulted in standardized sizes for the verticals, diagonals and chord members, making fabrication and assembly relatively easy. In the highly competitive bridge market, in which efficiency equated with profit, Pratt trusses received almost universal use. "The Pratt truss is the type most commonly used in America for spans under two hundred and fifty feet in length," noted bridge engineer J.A.L. Waddell wrote in 1916. "Its advantages are simplicity, economy of metal, and suitability for connecting to the floor and lateral systems."

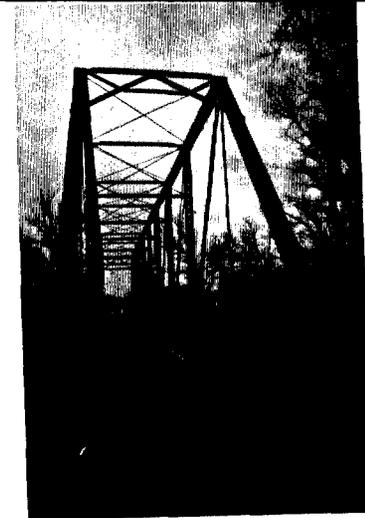

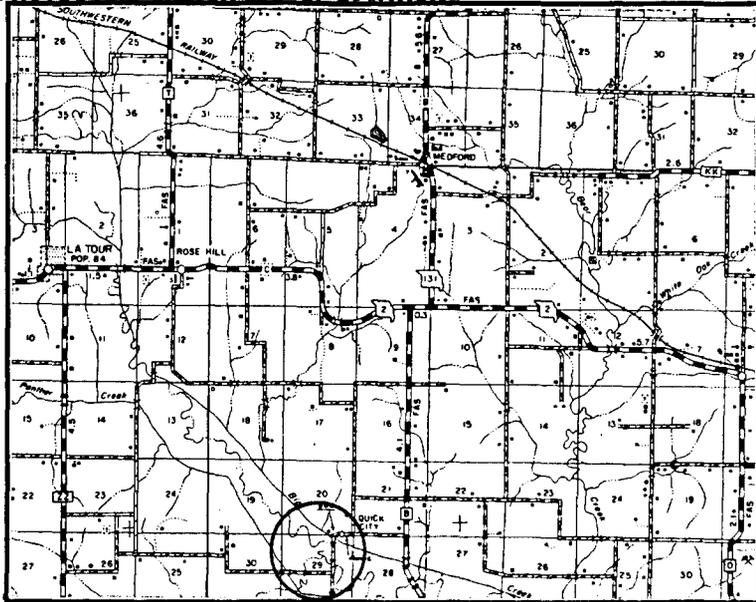

Standard Bridge began construction of these abutments in the spring of 1929. "Work of repairing and rebuilding bridges which were damaged or washed away by the floods late last fall is well under way," the *Star-Journal* reported in May. Standard shipped the truss to the site in its component parts, assembled it over timber falseworks and installed the floor system. By August the new bridge was completed and opened for traffic. A year later the original truss was salvaged from the stream, dismantled and moved to another crossing northeast of Holden. Since its erection, the Quick City Bridge has functioned in place, with only maintenance-related repairs to its deck.

Between the early 1880s, when trusses superseded bowstrings, and the 1920s, when riveted connections replaced pinned, the pin-connected Pratt truss was the metal structure of choice for medium- and long-span wagon bridges in Missouri. Virtually all of the major regional fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties in the late 19th and early 20th centuries. As a result, thousands of Pratt trusses were built across the state, and many remain in place today. Most extend less than 120 feet; several have spans greater than 150 feet. Only two 200-foot pinned Pratts are known to remain in Missouri, however: the Quick City Bridge in Johnson County and the Frenchman's Bluff Bridge in Lincoln County. Built at a time in which pin-connected trusses were considered an anachronism, the Quick City Bridge is significant as one of the longest examples in Missouri of this mainstay structural type.

total length: 27.0'

floor/decking: concrete deck

roadway wdt.: 15.5'

other features: concrete guardrail with incised panels on parapets

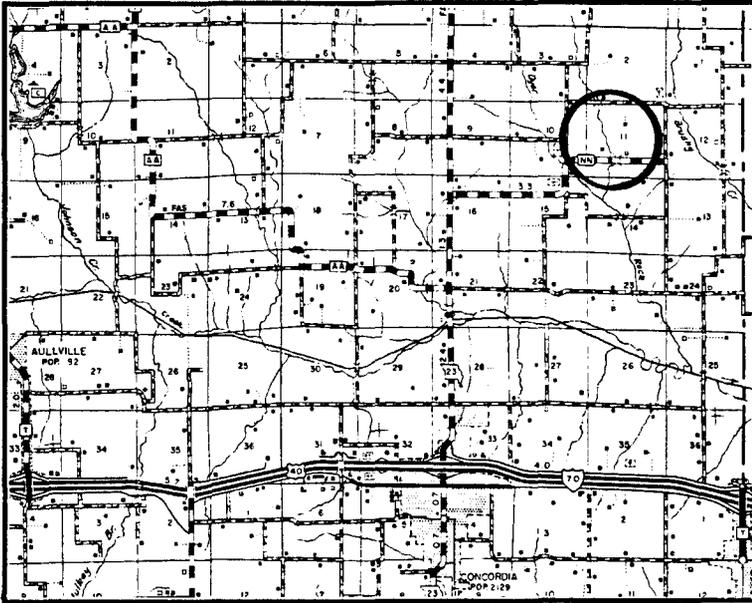

This small-scale concrete bridge carries State Secondary Route NN over Dyer Rock Creek northeast of Concordia. The structure features a concrete deck supported between the concrete mass abutments by a pair of through girders. It is simply detailed, with incised rectangular panels on the girder sides as the only architectural expression. The Dyer Rock Creek Bridge was built in 1917 by the Vermillion Brothers Contractors of Higginsville, Missouri, under contract with the Lafayette County Court. Since its completion, the bridge has functioned in place, without substantial alteration.

Unlike many Midwestern states, Missouri did not employ reinforced concrete extensively for construction of vehicular bridge superstructures in the 1910s. The various counties and, to a lesser extent, the state highway department continued to prefer steel for bridge superstructures well after concrete had received widespread acceptance elsewhere. This, combined with subsequent attrition, has resulted in a relatively small number of concrete bridges that exist today from this formative period. The Dyer Rock Creek Bridge is distinguished among these as one of less than ten concrete through girders found in the state. Modestly scaled and simply detailed, it is noteworthy as an early, well-preserved example of concrete bridge construction in Missouri.

substructure: concrete abutments and wingwalls; steel pile bent piers
floor/decking: concrete deck over steel stringers
other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 angles with batten plates; vertical: 4 angles with continuous plate; diagonal: 2 angles with batten plates; lateral bracing: 1 angle; floor beam: I-beam; guardrail: lattice

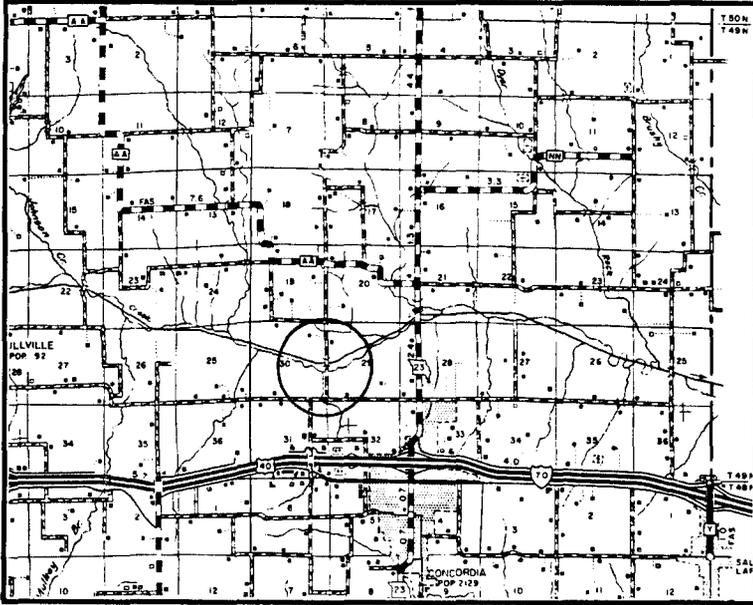

Carrying a gravel-surfaced road over Davis Creek some two miles northwest of Concordia, this 96-foot bridge is located in east-central Lafayette County. Configured as a polygonal Warren pony truss, the superstructure rests on concrete and steel substructure. The Davis Creek Bridge features riveted connections throughout and is approached on either end by steel stringers. Structure Inventory and Appraisal records indicate that the bridge was erected in 1940, which is uncorroborated in other county records. This bridge continues to carry intermittent vehicular traffic and maintains an average degree of historical integrity.

The Davis Creek Bridge is one of ten rigid-connected, polygonal Warren pony trusses included in Missouri's statewide inventory. All of these crossings were built in the 1930s and 1940s, most on primary system roadways. Its profile differs from the MSHD design, however, indicating an outside design source. It is possible that the truss was salvaged and moved to this location, perhaps from another state.

Mitchell Creek Bridge

PLAT01

GENERAL DATA

structure no.: F 151	city/town: Parkville
county: Platte	feature inters.: Mitchell Creek
	cadastral grid: S35, T51N, R34W
	highway route: State Supplementary Route FF
	highway distr.: 4
	current owner: State of Missouri

STRUCTURAL DATA

superstructure: concrete filled spandrel arch	
substructure: concrete abutments and wingwalls	
span number: 1	condition: good
span length: 30.0'	alterations: none
total length: 34.0'	floor/decking : asphalt over earth fill
roadway width: 24.0'	other features: cantilevered sidewalks; concrete guardrails

HISTORICAL DATA

erection date: 1922-23	
erection cost: \$10,055.50	
designer: Missouri State Highway Department	
fabricator : none	
contractor: L.A. Woods Construction Company	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number F 151; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO; Missouri State Highway Commission, Third Biennial Report , 1921-22, pages 127-28, 131.	
sign. rating: 47	
evaluation: NRHP possibly eligible (well-preserved, early example of MSHD concrete bridge design)	

inventoried by: Clayton B. Fraser 5 August 1992

Platte River Bridge

PLAT02

GENERAL DATA

structure no.: K 266R	city/town: 1.3 miles southwest of Platte City
county: Platte	feature inters.: Platte River
	cadastral grid: S35, T53N, R35W
	highway route: State Highway 45
	highway distr.: 4
	current owner: State of Missouri

STRUCTURAL DATA

superstructure: steel, 9-panel, rigid-connected Parker through truss
substructure: concrete abutments, wingwalls and piers

span number: 3	condition: fair
span length: 180.0'	alterations: maintenance-related repairs, 1988
total length: 548.0'	floor/decking : concrete deck over steel stringers
roadway width: 22.0'	other features: upper chord and inclined end post: 2 channels with cover and batten plates; lower chord: 2 channels with cover and batten plates; vertical: 4 angles with lacing or 2 channels with lacing; diagonal: 2 angles with batten plates; lateral bracing: 1 angle; strut: 2 angles; floor beam: I-beam, field-bolted to verticals; guardrail: 2 channels; bridge plate: MISSOURI / HIGHWAY DEPT / BRIDGE No K 266 / 1933

HISTORICAL DATA

erection date: 1933
erection cost: \$58,161.50
designer: Missouri State Highway Department
fabricator : Inland Steel Company, East Chicago IN
contractor: Snyder and Johnson, Humboldt IA

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 266R; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO; Missouri State Highway Commission Biennial Report, page 187 (1933); field inspection by Lon Johnson, 3 February 1991

sign. rating: 48
evaluation: NRHP possibly eligible (well-preserved, multiple-span example of MSHD long-span truss design)

inventoried by: Michelle Crow-Dolby 5 August 1992

Fairfax Bridge

PLAT03

GENERAL DATA

structure no.:	K 456R	city/town:	Kansas City
county:	Platte / Wyandotte	feature inters.:	Missouri River
		cadastral grid:	S8/9, T50N, R33W
		highway route:	US Highway 69
		highway distr.:	4
		current owner:	State of Missouri / State of Kansas

STRUCTURAL DATA

superstructure:	2 rigid-connected, cantilevered through truss channel spans flanked by 2 rigid-connected Warren through trusses with polygonal upper chords at each end; 3 rigid-connected Warren deck trusses at each end; 1 steel stringer approach span at each end		
substructure:	concrete abutments, wingwalls and piers (four in river, ten on land)		
span number:	2	condition:	good
span length:	475.0'	alterations:	concrete deck replaced with steel grid and guardrails replaced, 1979
total length:	1298.0'	floor/decking :	asphalt over steel grid
roadway width:	20.0'	other features:	upper chord and inclined end post: 2 channels with double lacing; lower chord: 2 built-up channels with double lacing on both ends or 2 built-up channels with cover and batten plates; vertical: 4 angles with batten plate or 2 channels with double lacing or 2 face-to-face channels with batten plates or 2 channels with lacing; diagonal: 4 angles with batten plate or 2 channels with batten plates or 2 channels with double lacing; lateral bracing: 2 angles with lacing; strut: 4 angles with lacing, braced; floor beam: I-beams; guard-rail: steel

HISTORICAL DATA

erection date:	1933-35
erection cost:	\$511,500.00 (contract amount)
designer:	Sverdrup and Parcel, St. Louis MO
fabricator :	Kansas City Bridge Company, Kansas City MO
contractor :	Kansas City Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 456R; *Kansas City Star*: 17 February 1933, 26 May 1933, 12 July 1933, 29 September 1933, 23 April 1940, 12 January 1942, 12 April 1942; *Kansas City Times*: 2 December 1933, 13 May 1935, 7 March 1938; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO; field inspection by Lon Johnson, 3 February 1991.

Fairfax Bridge

sign. rating: 62

evaluation: NRHP possibly eligible (noteworthy example of large-scale truss construction on interstate crossing of Missouri River)

inventoried by: Michelle Crow-Dolby 5 August 1992

Bear Creek Bridge

PLAT04

GENERAL DATA

structure no.:	K 491	city/town:	Weston
county:	Platte	feature inters.:	Bear Creek
		cadastral grid:	S12, T53N, R36W
		highway route:	State Highway 45
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel plate through girder, skewed, with two steel stringer approach spans		
substructure:	concrete abutments, wingwalls and piers		
span number:	1	condition:	good
span length:	100.0'	alterations:	none
total length:	167.0'	floor/decking :	concrete deck over steel stringers
roadway width:	22.0'	other features:	steel guardrails

HISTORICAL DATA

erection date:	1936
erection cost:	\$15,923.32
designer:	Missouri State Highway Department
fabricator :	unknown
contractor :	Mike Haase
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 491; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO.
sign. rating:	54
evaluation:	NRHP possibly eligible (long-span example of MSHD beam bridge design)

inventoried by: Clayton B. Fraser 5 August 1992

Weston Viaduct

PLAT05

GENERAL DATA

structure no.:	K 698	city/town:	Weston
county:	Platte	feature inters.:	Burlington Northern Railroad
		cadastral grid:	S11/12, T53N, R36W
		highway route:	State Highway 45
		highway distr.:	4
		current owner:	Missouri Highway and Transportation Department

STRUCTURAL DATA

superstructure:	steel plate through girder, with four steel stringer approach spans		
substructure:	concrete abutments and wingwalls and spill-through piers		
span number:	1	condition:	good
span length:	115.0'	alterations:	none
total length:	327.0'	floor/decking :	concrete deck over steel stringers
roadway width:	24.0'	other features:	concrete guardrails

HISTORICAL DATA

erection date:	1936
erection cost:	\$41,672.55
designer:	Missouri State Highway Department
fabricator :	unknown
contractor:	Mike Haase / Oscar H. Schmidt
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 698; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO.
sign. rating:	54
evaluation:	NRHP possibly eligible (long-span example of MSHD beam bridge design)

inventoried by: Clayton B. Fraser 5 August 1992

Highway 92 Viaduct

PLAT06

GENERAL DATA

structure no.: K 754R	city/town: 4.8 miles west of Platte City
county: Platte	feature inters.: Missouri Route 45 and railroad tracks
	cadastral grid: S31, T53N, R35W
	highway route: State Highway 92
	highway distr.: 4
	current owner: State of Missouri

STRUCTURAL DATA

superstructure: steel stringer	
substructure: concrete abutments, wingwalls and piers	
span number: 16	condition: good
span length: 50.0'	alterations: none
total length: 699.0'	floor/decking : concrete deck over steel stringers
roadway width: 24.0'	other features: strut: 4 angles, braced; floor beam: I-beam; concrete balustrade guardrails

HISTORICAL DATA

erection date: 1939	
erection cost: \$78,511.80	
designer: Missouri State Highway Department	
fabricator : Inland Steel Company, East Chicago IN	
contractor: Fred M. Clark and Son	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 754R; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO; field inspection by Lon Johnson, 3 February 1991.	
sign. rating: 45	
evaluation: NRHP non-eligible (undistinguished multiple-span example of MSHD beam bridge design)	

inventoried by: Michelle Crow-Dolby 5 August 1992

Platte River Bridge

PLAT07

GENERAL DATA

structure no.: L 354R1	city/town: 0.5 mile north of Platte City
county: Platte	feature inters.: Platte River
	cadastral grid: S25, T53N, R35W
	highway route: county road
	highway distr.: 4
	current owner: Platte County

STRUCTURAL DATA

superstructure: three steel plate deck girders with seven steel stringer approach spans	
substructure: concrete abutments and wingwalls; hammerhead spill-through piers	
span number: 1; 2	condition: good
span length: 115.0'; 92.0'	alterations: deck widened, 1975
total length: 704.0'	floor/decking : concrete deck over steel stringers
roadway width: 38.0'	other features: concrete with steel pipe guardrails

HISTORICAL DATA

erection date: 1950-51
erection cost: \$276,079.28
designer: Missouri State Highway Department
fabricator : unknown
contractor: Maxwell Bridge Company
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number L 354R1; Files on primary system bridges on file at Missouri Highway and Transportation Department, Jefferson City MO.
sign. rating: 38
evaluation: NRHP non-eligible (relatively late example of MSHD long-span beam bridge design, altered)

Inventoried by: Michelle Crow-Dolby 5 August 1992

Interurban Road Bridge

PLAT08

GENERAL DATA

structure no.:	N236B11	city/town:	Kansas City
county:	Platte	feature inters.:	Todd Creek
		cadastral grid:	
		highway route:	Northwest Interurban Road
		highway distr.:	4
		current owner:	Platte County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments, wingwalls and pier		
span number:	2	condition:	fair
span length:	52.0'	alterations:	guardrails replaced with Armco
total length:	108.0'	floor/decking :	asphalt over earth fill
roadway width:	16.0'	other features:	Armco guardrails

HISTORICAL DATA

erection date:	c1920
erection cost:	unknown
designer:	unknown
fabricator :	none
contractor :	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number N236B11.

sign. rating:	19
evaluation:	NRHP non-eligible (poorly preserved, poorly documented example of concrete arch construction)

inventoried by: Michelle Crow-Dolby 5 August 1992

Interurban Road Bridge

PLAT09

GENERAL DATA

structure no.:	N237B32	city/town:	Kansas City
county:	Platte	feature inters.:	Wildcat Branch
		cadastral grid:	
		highway route:	Northwest Interurban Road
		highway distr.:	4
		current owner:	Platte County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments, wingwalls and pier		
span number:	2	condition:	fair
span length:	26.0'	alterations:	guardrails replaced with Armco
total length:	54.0'	floor/decking :	asphalt over earth fill
roadway width:	15.5'	other features:	Armco guardrails

HISTORICAL DATA

erection date:	c1920
erection cost:	unknown
designer:	unknown
fabricator :	none
contractor :	unknown
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number N237B32.
sign. rating:	16
evaluation:	NRHP non-eligible (poorly preserved, poorly documented example of concrete arch construction)

inventoried by: Michelle Crow-Dolby 5 August 1992

Sugar Creek Bridge

PLAT11

GENERAL DATA

structure no.: 006000.4	city/town: 10.3 miles northwest of Weston
county: Platte	feature inters.: Sugar Creek
	cadastral grid: S2/35, T54/55N, R37W
	highway route: County Road 6
	highway distr.: 4
	current owner: Platte County

STRUCTURAL DATA

superstructure: steel, 6-panel, 2-angle rigid-connected Camelback pony truss; 1 steel stringer approach on west end	
substructure: steel pile bent piers and timber back- and wingwalls	
span number: 1	condition: fair
span length: 130.0'	alterations: none
total length: 131.0'	floor/decking : timber deck over steel stringers
roadway width: 14.0'	other features: upper chord and inclined end post, lower chord, vertical, diagonal: 2 angles; lateral bracing: round rods with threaded ends; strut: 1 angle, knee braced; floor beam: I-beams; guardrail: 2 angles

HISTORICAL DATA

erection date: c1925	
erection cost: unknown	
designer: unknown	
fabricator : Inland Steel Company, East Chicago IN	
contractor : unknown	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 006000.4; field inspection by Lon Johnson, 6 February 1991.	
sign. rating: 45	
evaluation: NRHP non-eligible (long-span example of uncommon structural type, largely undocumented)	

inventoried by: Michelle Crow-Dolby 5 August 1992

Iatan Bridge

PLAT12

GENERAL DATA

structure no.:	016000.1	city/town:	Iatan
county:	Platte	feature inters.:	Iatan Creek
		cadastral grid:	S23, T54N, R36W
		highway route:	County Road 16
		highway distr.:	4
		current owner:	Platte County

STRUCTURAL DATA

superstructure:	wrought iron, 3-panel, pin-connected Pratt pony truss, with timber stringer approach on north end		
substructure:	concrete-filled iron cylinder piers with timber pile abutments and back-and-wingwalls		
span number:	1	condition:	fair
span length:	50.0'	alterations:	none
total length:	65.0'	floor/decking :	timber deck over timber stringers
roadway width:	12.5'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: I-beam with star-iron outrider; counter: round eye-rod with turnbuckle; lateral bracing: round rod; floor beam: I-beam U-bolted to lower chord pins; guardrail: timber

HISTORICAL DATA

erection date:	1885
erection cost:	unknown
designer:	Missouri Valley Bridge and Iron Company, Leavenworth KS
fabricator :	Missouri Valley Bridge and Iron Company, Leavenworth KS
contractor:	Missouri Valley Bridge and Iron Company, Leavenworth KS
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 016000.1; Platte County Court Record, Book L: page 538 (17 April 1876); Book M: page 5 (17 June 1876) - located at the Platte County Courthouse, Platte City MO; W.M. Paxton, <i>Annals of Platte County, Missouri</i> , pages 622, 825; field inspection by Lon Johnson, 6 February 1991.
sign. rating:	51
evaluation:	NRHP possibly eligible (well-preserved, early example of mainstay structural type)

Inventoried by: Clayton B. Fraser 5 August 1992

Platte River Bridge

PLAT15

GENERAL DATA

structure no.: 130000.0	city/town: 4.0 miles northeast of Platte City
county: Platte	feature inters.: Platte River
	cadastral grid: S16, T53N, R34W
	highway route: Interurban Road
	highway distr.: 4
	current owner: Platte County

STRUCTURAL DATA

superstructure: steel, rigid-connected Pratt through truss
substructure: concrete abutments, wingwalls and piers

span number: 2	condition: good
span length: 160.0'	alterations: railroad bridge re-decked for roadway use
total length: 326.0'	floor/decking : timber deck over steel stringers
roadway width: 15.0'	other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 4 angles with batten plates; vertical: 2 channels with lacing (4 angles with lacing at hip); diagonal: 2 channels with lacing or 4 angles with lacing; lateral bracing: 4 angles with lacing or 2 angles; floor beam: steel girder and railroad ties; guardrail: cable

HISTORICAL DATA

erection date: c1920
erection cost: unknown
designer: Kansas City, Clay County and St. Joseph Railroad
fabricator : unknown
contractor: Kansas City, Clay County and St. Joseph Railroad

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 130000.0; field inspection by Lon Johnson, 6 February 1991.

sign. rating: 32
evaluation: NRHP non-eligible (railroad bridge modified for roadway use)

inventoried by: Michelle Crow-Dolby 5 August 1992

Jowler Creek Bridge

PLAT16

GENERAL DATA

structure no.: 136001.7	city/town: 4.3 miles northeast of Platte City
county: Platte	feature inters.: Jowler Creek
	cadastral grid: S6, T53N, R34W
	highway route: County Road 136
	highway distr.: 4
	current owner: Platte County

STRUCTURAL DATA

superstructure: concrete filled spandrel arch	
substructure: concrete abutments, wingwalls and pier	
span number: 2	condition: fair
span length: 48.0'	alterations: none
total length: 95.0'	floor/decking : earth fill over concrete
roadway width: 16.4'	other features: bullnosed cutwater on pier

HISTORICAL DATA

erection date: c1920
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 136001.7; field inspection by Lon Johnson, 6 February 1991.

sign. rating: 30
evaluation: NRHP non-eligible (poorly documented example of pre-MSHD concrete arch construction)

inventoried by: Michelle Crow-Dolby 5 August 1992

Jowler Creek Bridge

PLAT17

GENERAL DATA

structure no.:	138003.0	city/town:	4.0 miles northeast of Platte City
county:	Platte	feature inters.:	Jowler Creek
		cadastral grid:	S16, T53N, R34W
		highway route:	County Road 138
		highway distr.:	4
		current owner:	Platte County

STRUCTURAL DATA

superstructure:	steel, rigid-connected, 2-angle Pratt pony truss		
substructure:	timber pile bent piers with concrete caps, timber back- and wingwalls		
span number:	1	condition:	fair
span length:	60.0'	alterations:	none
total length:	60.0'	floor/decking :	concrete over corrugated steel
roadway width:	18.0'	other features:	upper chord and inclined end post, lower chord, vertical: 2 angles; diagonal: 1 angle; counter: 1 angle; lateral bracing: round rods with threaded ends; strut: 1 angle, knee-braced; floor beam: I-beams; guardrail: 2 angles

HISTORICAL DATA

erection date:	c1920
erection cost:	unknown
designer:	unknown
fabricator :	Inland Steel Company, East Chicago IN
contractor:	unknown
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 138003.0; field inspection by Lon Johnson, 6 February 1991.
sign. rating:	32
evaluation:	NRHP non-eligible (largely undocumented example of uncommon structural type)

inventoried by: Michelle Crow-Dolby 5 August 1992

Bee Creek Bridge

PLAT18

GENERAL DATA

structure no.:	160000.4	city/town:	5.0 miles west of Platte City
county:	Platte	feature inters.:	Bee Creek
		cadastral grid:	S30, T53N, R35W
		highway route:	County Road 160
		highway distr.:	4
		current owner:	Platte County

STRUCTURAL DATA

superstructure:	steel, 7-panel, pin-connected Pratt through truss		
substructure:	steel pile bent piers with timber back- and wingwalls		
span number:	1	condition:	fair
span length:	112.0'	alterations:	none
total length:	112.0'	floor/decking :	timber deck over steel stringers
roadway width:	11.6'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing (2 angles with batten plates at hip); diagonal: 2 punched rectangular eyebars; counter: round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam, field-bolted to vertical; guardrail: 2 angles; endpost-mounted builder's plate: 1910 / BUILT BY / MISSOURI VALLEY / BRIDGE AND / IRON COMPANY

HISTORICAL DATA

erection date:	1910
erection cost:	unknown
designer:	Missouri Valley Bridge and Iron Company, Leavenworth KS
fabricator :	Missouri Valley Bridge and Iron Company, Leavenworth KS
contractor:	Missouri Valley Bridge and Iron Company, Leavenworth KS
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 160000.4; field inspection by Lon Johnson, 3 February 1991.
sign. rating:	41
evaluation:	NRHP non-eligible (typically configured example of mainstay structural type)

inventoried by: Michelle Crow-Dolby 5 August 1992

Cordon's Ferry Bridge

PLAT20

GENERAL DATA

structure no.: 175000.8	city/town: 3.0 miles southwest of Platte City
county: Platte	feature inters.: Platte River
	cadastral grid: S10, T52N, R35W
	highway route: County Road 175
	highway distr.: 4
	current owner: Platte County

STRUCTURAL DATA

superstructure: steel, 7-panel, pin-connected Pratt through truss, with steel stringer approach spans	
substructure: concrete-filled steel cylinder piers, timber back- and wingwalls; partial stone backwall on east	
span number: 1	condition: poor
span length: 150.0'	alterations: upper chords braced with steel beams; three verticals replaced
total length: 188.0'	floor/decking : timber deck over steel stringers
roadway width: 14.0'	other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing (2 looped square eyebars at hip); diagonal: 2 punched rectangular eyebars; counter: square eyerod with turn-buckle; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam; guardrail: woven wire

HISTORICAL DATA

erection date: 1895	
erection cost: \$4200.00 (contract amount)	
designer: Missouri Valley Bridge and Iron Company, Leavenworth KS	
fabricator : Missouri Valley Bridge and Iron Company, Leavenworth KS; Carnegie Steel Company, Pittsburgh PA	
contractor : Missouri Valley Bridge and Iron Company, Leavenworth KS	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 175000.8; Platte County Road Book B: page 395 (7 September 1895), page 401 (3 June 1895) - located at the Platte County Courthouse, Platte City MO; field inspection by Lon Johnson, 3 February 1991.	
sign. rating: 46	
evaluation: NRHP non-eligible (well-documented example of mainstay structural type, substantially altered)	

inventoried by: Michelle Crow-Dolby 5 August 1992

USE (ORIGINAL / CURRENT)

roadway bridge / roadway bridge

RATING NRHP non-eligible (score: 46)

CONDITION

poor

OWNER

Platte County

span number: 1
span length: 150.0'
total length: 188.0'
roadway wdt.: 14.0'

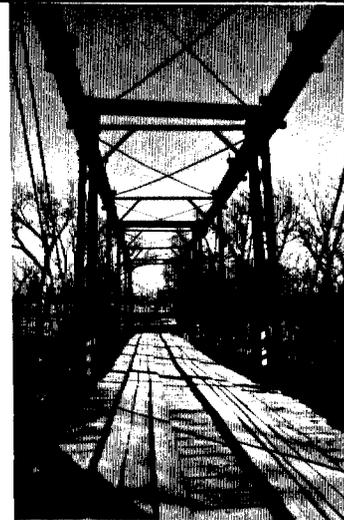

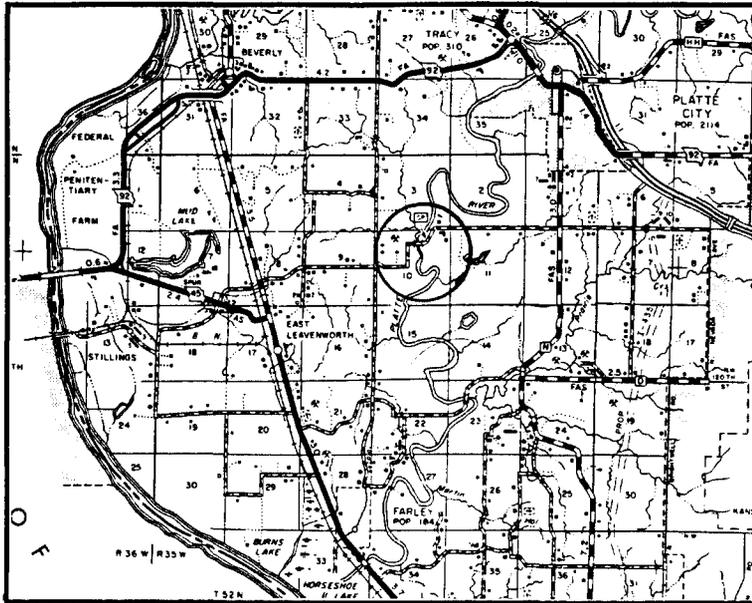

superstructure: steel, 7-panel, pin-connected Pratt through truss, with steel stringer approach spans
substructure: concrete-filled steel cylinder piers, timber back- and wingwalls; partial stone backwall on east
floor/decking: timber deck over steel stringers
other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing (2 looped square eyebars at hip); diagonal: 2 punched rectangular eyebars; counter: square eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam; guardrail: woven wire

In June 1895, the Platte County Road and Bridge Commissioner was directed by the county court to solicit competitive proposals for the erection of this bridge, located at the site of Cordon's Ferry southwest of Platte City. Reporting in September the same year that the Missouri Valley Bridge and Iron Company was the low bidder, the bridge commissioner subsequently awarded the company with a \$4200.00 construction contract for this 188-foot structure. Using steel components rolled in Pittsburgh by Carnegie Steel Company, the Leavenworth, Kansas contractor completed the crossing later that year. The seven-panel Pratt through truss, spanning the Platte River, features a timber deck and pinned connections throughout. The entire truss is supported by steel cylinder piers with stone and timber backwalls. Since its completion in 1895, Cordon's Ferry Bridge has functioned in place. It has more recently been altered through the addition of steel beams over its upper chords and the replacement of three of its verticals.

In the early 1880s, the pin-connected Pratt truss superseded the bowstring arch-truss as the iron bridge of choice for medium-span wagon crossings. Patented in 1844 by Thomas and Caleb Pratt, the Pratt design is distinguished by vertical members acting in compression and diagonals that act in tension. "The Pratt truss in the type most commonly used in America for spans under two hundred and fifty (250) feet in length," noted bridge engineer J.A.L. Waddell in 1916. "Its advantages are simplicity, economy of metal, and suitability for connection to the floor and lateral systems." Virtually all of the regional bridge fabricators manufactured Pratt trusses and marketed them extensively to Missouri's counties. The Missouri Valley Bridge and Iron Company was a major player in western Missouri during the late 19th century, and the Cordon's Ferry Bridge represents that company's penchant for pinned truss construction.

One of the provisions of the Hawes Road Law establishing the Missouri State Highway Department was that the newly formed agency develop plans and specifications for bridges and culverts. "The Highway Department has maintained a drafting room which has been called upon for many kinds of service," the department reported in 1918, "but the especial function of which has been the preparation of bridge and culvert designs." By 1920, the department had developed several standards for short- and medium-span bridges, including 13 designs for steel superstructures with spans ranging up to 100 feet. In addition, the department delineated some 185 special bridge designs during the 1919-20 biennium. In 1922 MSHD designed some 293 spans with a total length of over 20,000 feet. One of these was a structure over Mitchell Creek in Parkville, a concrete filled spandrel arch with a 30-foot span. MSHD engineers designed the structure late in 1922, and solicited competitive bids for its construction. When proposals were received in December, the low bidder was the L.A. Woods Construction Company at \$10,055.50. The contractor completed the bridge and another 70-foot span (recently demolished) in 1923; the Mitchell Creek Bridge has continued to function in place, without alteration. It is historically significant as one of the few structures left intact from MSHD's formative years—a small-scale concrete arch that represents early highway bridge building in Missouri.

superstructure: steel, 9-panel, rigid-connected Parker through truss
substructure: concrete abutments, wingwalls and piers
floor/decking: concrete deck over steel stringers
other features: upper chord and inclined end post: 2 channels with cover and batten plates; lower chord: 2 channels with cover and batten plates; vertical: 4 angles with lacing or 2 channels with lacing; diagonal: 2 angles with batten plates; lateral bracing: 1 angle; strut: 2 angles; floor beam: I-beam, field-bolted to verticals; guardrail: 2 channels; bridge plate: MISSOURI / HIGHWAY DEPT / BRIDGE No K 266 / 1933

Carrying Missouri State Highway 45 in western Platte County, this large-scale riveted Parker through truss crosses the Platte River. Featuring a concrete deck over steel stringers and a concrete substructure, the overall bridge length is 548 feet. Designed by the Missouri State Highway Department, the structure was built by Snyder and Johnson for a total cost of \$58,161.50. The Humboldt, Iowa, contractors used steel components rolled in East Chicago, Indiana, by Inland Steel Company, completing the three-span bridge in 1933. Functioning in place today southwest of Platte City, the Platte River Bridge retains a high degree of structural integrity with only maintenance-related repairs.

The Platte River Bridge is technologically significant as a well-preserved example of a relatively uncommon structural type. Pin-connected Pratt trusses were built by the thousands throughout Missouri in the late 19th and early 20th centuries. Pinned Parker trusses, a polygonal-chorded Pratt variant, were typically used for crossings requiring long spans, where a savings in materials could be effected by angling the upper chords. Riveted Parker trusses such as the Platte River Bridge were built far less often than Pratts; fewer than three dozen remain in place today on Missouri's road system. Among these, the Platte River Bridge is distinguished by its multiplicity of spans and its excellent degree of historical and structural integrity.

Early efforts to connect Platte County, Missouri, and Kansas' Wyandotte County had long proved unsuccessful, owing to the wide expanse of the Missouri River at this location and the resulting high costs of building such a long bridge. It was not until Frank A. Davis, secretary of the Greater Kansas City Regional Plan Association, established the Regional Bridge Company in the early 1930s that fund raising for the crossing became a reality. Organizing civic and business leaders from both banks of the Missouri, Davis spearheaded the attempt to secure adequate funding for the construction of a bridge that would link the two counties. Both the Kansas and Missouri highway departments agreed to finance and furnish labor for the construction of the bridge's approaches and any additional road and sidewalk renovation. Soon after, early in 1933, the Regional Bridge Company procured a \$600,000.00 loan from the Reconstruction Finance Corporation in order to build the large-scale structure. The bridge was to be operated as a toll crossing until its bonds could be retired and the loan paid off. Regional officers wasted little time and quickly advertised for competitive construction bids, using plans and specifications delineated by the St. Louis bridge engineering firm of Sverdrup and Parcel, for the rigid-connected, cantilevered structure. Late in May, a contract was let by the executive committee of the Regional Bridge Company to the lowest of six bidders, the Kansas City Bridge Company of Missouri. The bridge contractor agreed to fabricate and erect the massive steel through trusses and substructure for \$511,500.00 by May 1, 1934.

Concrete in the four river piers was placed first, using pneumatic caissons to sink the concrete and steel piers to bedrock 110 feet below the water's surface. Men working under the water constructing these piers were often called "sandhogs" by their fellow workers. Sandhogs' working hours were strictly regulated by the federal government, owing to dangerous air pressure conditions underwater. One newspaper reported that "[Sandhogs] are not permitted to work more than one and one-half hours in any twenty-four hours at a depth greater than ninety-eight feet." Work on the bridge's substructure was completed without any reported injuries or mishaps. Steel work on the two cantilevered through trusses, and the two Warren through trusses was successfully finished by KCBCo by the deadline specified in the contract. The bridge was completed in 1934 but was not opened to the public until May 12th, owing to a delay in the construction of the approaches. Unfortunately, this delay caused the toll crossing to open for business already hundreds of thousands of dollars behind in the loan repayment schedule.

In 1938, three years after the toll bridge's opening to public traffic, the structure still had not been able to pay off even the interest on the loan. Critics claimed this failure to generate sufficient money to repay the loan was due to the "failure to properly mark the highways leading to the bridge and reluctance of motorists to pay toll collections." The problem of not enough paying motorists using the bridge because of prohibitive fees continued until 1940 when the toll situation was reexamined. Harry Darby, chairman of the industrial development commission of the Kansas City Chamber of Commerce, went so far as to say that toll crossings acted as a traffic barrier. "Nothing has been paid on the principal of that loan [from the Reconstruction Finance Corporation]," Darby stated, "and motorists avoid the [Fairfax] bridge because of the toll charges." After careful analysis of the situation, a solution was discovered. It was found that more motorists would use the bridge if toll charges were dramatically reduced, and a profit would actually be realized. Additionally, civic leaders negotiated a new financing plan for the bridge's \$600,000.00 loan. The new, lower toll fees in place, the Fairfax Bridge effectively paid of its loan within the next fifteen years, reemerging as a free highway crossing.

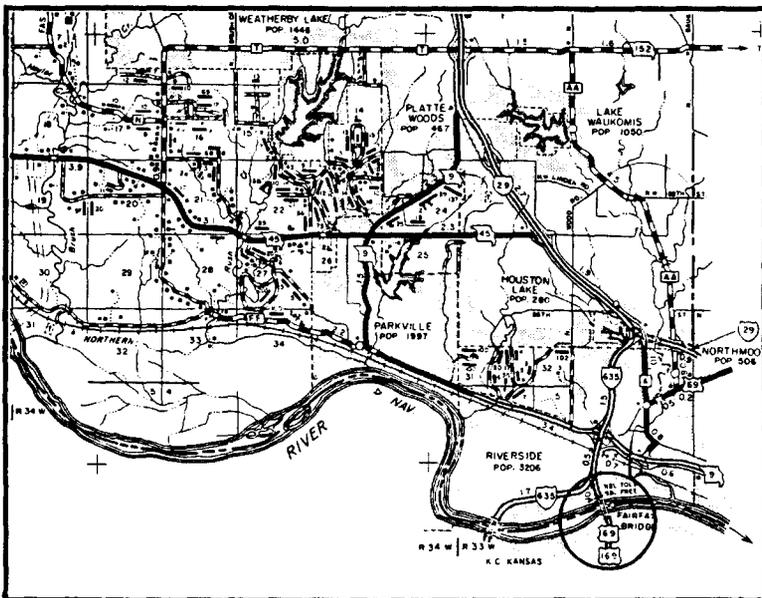

Since its construction, the Fairfax Bridge has continued to service regional traffic on U.S. Highway 69 between Missouri Kansas with few major alterations. In 1979 the concrete deck was replaced with a newer steel grid, and modern guardrails were installed at a cost of \$2,570,101.90. The Fairfax Bridge retains a high degree of both historical and visual integrity, thus making it a significant Missouri River crossing.

Undertaken during the early years of the Great Depression, the Fairfax Bridge marked the first of what would be a series of great river bridges built in the state. It has formed a regionally important crossing of the Missouri River. Featuring a cantilevered design, the Fairfax Bridge ranks among Missouri's most monumental examples of steel truss construction. With a span length of 475 feet and an overall length of almost 1300 feet, the multiple-span structure clearly ranks as a superlative example of its type. Its distinctive curved profile was representative of the great river bridges undertaken by L.J. Sverdrup. Similarly configured structures undertaken by Sverdrup and Parcel include the Mark Twain Bridge in Hannibal, the Miami Bridge, the Hermann Bridge and the Washington Bridge. As an important river crossing and a well-preserved example of large-scale bridge construction, the Fairfax Bridge is one of Missouri's more noteworthy highway trusses.

superstructure: steel plate through girder, skewed, with two steel stringer approach spans

substructure: concrete abutments, wingwalls and piers

floor/decking: concrete deck over steel stringers

other features: steel guardrails

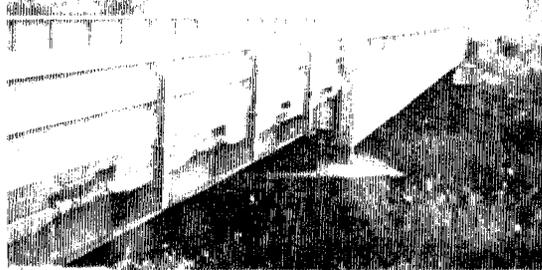

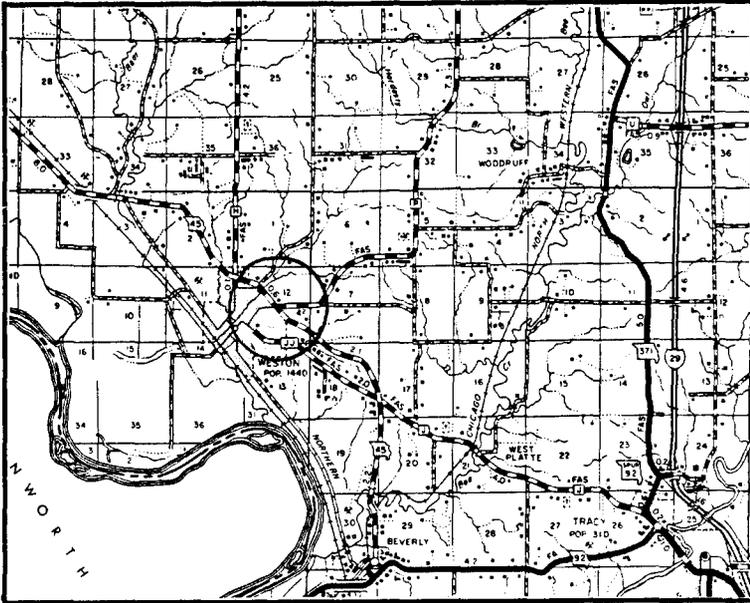

This three-span bridge carries State Highway 45 over Bear Creek in the small town of Weston. The structure consists of a single long-span, riveted plate through girder, flanked by two steel stringer approach spans; the superstructure is supported by concrete piers and abutments. The Bear Creek Bridge was engineered by the Missouri State Highway Department in 1936. Designating the project as Project WPGH-791(B), the agency solicited competitive proposals in June. That month the state highway commission awarded a contract to build the bridge to Mike Haase. The contractor apparently completed the structure later that year for \$15,923.32. Since that time the bridge has functioned in place, with only minor maintenance-related repairs.

Through the 1930s and 1940s, the Missouri State Highway Department designed and built progressively longer steel beam bridges, using both rolled and plate girders in through and deck configurations. This culminated at the end of the decade with spans around 150 feet. Other longer girders had been built elsewhere in the country, but for Missouri, this represented a noteworthy technological feat. With its 100-foot through girder span and 1936 construction date, the Bear Creek Bridge is noteworthy as one of the earliest of these long-span beam bridges.

superstructure: wrought iron, 3-panel, pin-connected Pratt pony truss, with timber stringer approach on north end
substructure: concrete-filled iron cylinder piers with timber pile abutments and back- and wingwalls
floor/decking: timber deck over timber stringers
other features: upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eyebars; vertical: I-beam with star-iron outrider; counter: round eyerod with turnbuckle; lateral bracing: round rod; floor beam: I-beam U-bolted to lower chord pins; guardrail: timber

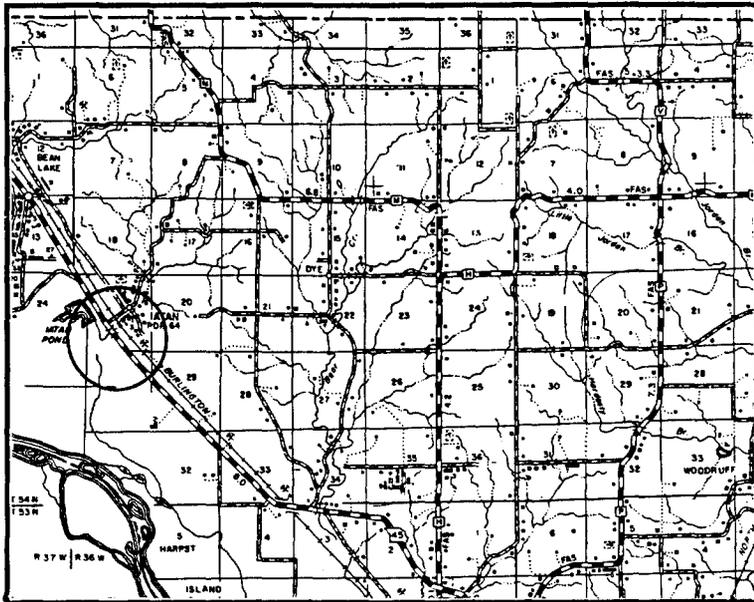

Located in the small town of Iatan, in the northwestern corner of Platte County, this small-scale iron truss spans Iatan Creek. The structure is comprised of a 50-foot Pratt pony truss with pinned connections, supported by iron cylinder piers and approached on one end by a single stringer span. The Iatan Bridge dates to 1875, two years after the town itself was founded. In September of that year, county road and bridge commissioner A.G. Smith prepared plans and specifications for a timber bridge at this crossing. Smith later hired a builder to erect the bridge, and in July 1876, the first Iatan Bridge was completed. The timber structure lasted less than ten years before the county began contemplating its replacement. On October 3, 1885, the court contracted with the Missouri Valley Bridge and Iron Company of Leavenworth, Kansas, for an all-iron span, to be erected on iron tubular piers. Missouri Valley presumably completed the new structure later that year. Since its completion, the Iatan Bridge has continued to carry vehicular traffic, without serious alteration.

As Platte County's oldest remaining truss, the Iatan Bridge is historically noteworthy as an intact remnant of early transportation. The structure is technologically significant as a very early example of Pratt pony truss construction—Missouri's mainstay structural type for short-span crossings in the 19th and 20th centuries. With its star iron outriders and U-bolted floor beams, the Iatan Bridge is a strong visual reminder of early truss bridge construction in Missouri.

This medium-scale Pratt through truss spans Bee Creek five miles west of Platte City. This single-span pinned structure is supported by a steel and timber substructure. The truss was erected in 1910 by the based Missouri Valley Bridge and Iron Company of Leavenworth, Kansas, an often-hired contractor in Platte County. Since its completion, the Bee County Bridge has functioned in place, with its superstructure intact. It is a typically configured example of a mainstay structural type in Missouri: the pinned Pratt through truss.

Lexington Bridge

RAY001

GENERAL DATA

structure no.:	G 55R	city/town:	Lexington
county:	Ray / Lafayette	feature inters.:	Missouri River
		cadastral grid:	S35, T51N, R27W
		highway route:	State Highway 13
		highway distr.:	4
		current owner:	State of Missouri

STRUCTURAL DATA

superstructure: two steel, 12-panel, rigid-connected Warren through trusses with polygonal upper chords; 5 steel, 7-panel, rigid-connected Warren through trusses with polygonal upper chords; 3 steel, 9-panel, rigid-connected, Warren deck trusses; 8 steel girder approach spans

substructure: concrete abutments, wingwalls and piers

span number:	10	condition:	excellent
span length:	408.0'	alterations:	bridge painted, 1973; deck repaired, 1985
total length:	3073.0'	floor/decking :	concrete deck over steel stringers
roadway width:	20.0'	other features:	Warren through trusses: upper chord: 2 channels with cover plate and lattice bars; lower chord: 4-angles with lacing and continuous cover plates; verticals: 2 channels with lacing alternating with 4 angles with lacing; diagonals: 2 channels with lacing; portals: 2 angles with lattice bars; struts: angles; top lateral bracing: 4 angles with lattice bars; bottom lateral bracing: angles; floor beams: I-beams; guardrails: lattice; (two center spans identical except, verticals: 4 angles with lacing; diagonals: 4 angles with lacing and cover plates); Warren deck trusses: upper chord: 4 angles with cover plates and lattice bars; lower chord: 4 angles with batten plates and cover plates; verticals: 4 angles with batten bars alternating with 2 channels with lacing; diagonals: 4 angles with lacing and cover plates; top and bottom lateral bracing: 2 angles; floor beams: 4 angles with continuous plate; bridge plaque: 1924 Lexington Bridge built by Lafayette County, Ray County, City of Lexington; Federal Aid appropriated by Missouri Highway Commission; Designed by J.A.L. Waddell, Consulting Engineer, New York, NY and Kansas City, MO; Supervised by Missouri State Highway Commission; B.H. Piepmeier, Chief Engineer; Contractor - Kansas City Bridge Co., Kansas City, MO

Lexington Bridge

HISTORICAL DATA

erection date: 1924-25
erection cost: \$1,086,294.15 (contract amount)
designer: J.A.L. Waddell, Kansas City MO
fabricator : Union Bridge and Construction Company, New York NY
contractor: Kansas City Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number G 55R; Ray County Court Record, Book 1: page 50 (16 August 1922), page 61 (11 September 1922), page 130 (5 December 1922) - located at the Ray County Courthouse, Richmond MO; *The Lexington News*, "Bridge Dedicated in 1925", written by Bonnie Mitchell, n.p. (11 November 1987); *Third Biennial Report of the Missouri State Highway Commission*, pages 112-13 (1922), page 120 (1924) - located in St. Louis MO; field inspection by Lon Johnson, 11 September 1990.

sign. rating: 86
evaluation: NRHP eligible (excellent example of large-scale highway bridge construction)

inventoried by: Michelle Crow-Dolby 3 August 1992

Henrietta Viaduct

RAY003

GENERAL DATA

structure no.:	K 900	city/town:	Henrietta
county:	Ray	feature inters.:	Wabash and Santa Fe Railroads
		cadastral grid:	S16, T51N, R27W
		highway route:	State Highway 13
		highway distr.:	4
		current owner:	State of Missouri

STRUCTURAL DATA

superstructure:	continuous I-beam steel stringer		
substructure:	concrete abutments and wingwalls with concrete spill-through piers		
span number:	12	condition:	good
span length:	78.0'	alterations:	none
total length:	705.0'	floor/decking :	concrete deck
roadway width:	26.0'	other features:	lateral bracing: crossed angles; guardrails: balustrade of channels and square rods with concrete approach guards; concrete sidewalk carried on cantilevered angles with steel plates

HISTORICAL DATA

erection date:	1946
erection cost:	\$180,956.25
designer:	Missouri State Highway Department
fabricator :	unknown
contractor:	J.A. Tobin Construction Company
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number K 900; field inspection by Lon Johnson, 11 September 1990.
sign. rating:	43
evaluation:	NRHP determined non-eligible (undistinguished, relatively late example of standard beam bridge type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Brushy Creek Bridge

RAY004

GENERAL DATA

structure no.:	013001.2	city/town:	2.7 miles northwest of Elmira
county:	Ray	feature inters.:	Brushy Creek
		cadastral grid:	S4, T54N, R29W
		highway route:	County Road 13
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 4-panel, rigid-connected, Warren pony truss		
substructure:	concrete-filled steel cylinder piers with concrete back- and wingwalls		
span number:	1	condition:	fair
span length:	60.0'	alterations:	none
total length:	60.0'	floor/decking :	timber deck over steel stringers
roadway width:	12.3'	other features:	upper chord and inclined end post: 2 channels with cover and batten plates; lower chord: 2 angles with batten plates; vertical: 2 angles; diagonal: 2 angles with batten plates; lateral bracing: round rods with threaded ends; floor beam: I-beams; guardrail: 2 channels; bridge plate: Kansas City Bridge Company / Builders / 1904

HISTORICAL DATA

erection date:	1904
erection cost:	unknown
designer:	Kansas City Bridge Company, Kansas City MO
fabricator :	Kansas City Bridge Company, Kansas City MO
contractor:	Kansas City Bridge Company, Kansas City MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 013001.2; field inspection by Lon Johnson, 9 September 1990.
sign. rating:	53
evaluation:	NRHP possibly eligible (earliest documented example in Missouri of the riveted Warren truss)

inventoried by: Michelle Crow-Dolby 3 August 1992

Bisbee Bridge

RAY005

GENERAL DATA

structure no.:	076001.8	city/town:	3.0 miles northwest of Millville
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S32, T54N, R27W
		highway route:	County Road 76
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 5-panel, pin-connected Pratt pony truss		
substructure:	unknown		
span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	80.0'	floor/decking :	timber deck over steel stringers
roadway width:	12.8'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1910
erection cost:	unknown
designer:	Kansas City Bridge Company, Kansas City MO
fabricator :	Kansas City Bridge Company, Kansas City MO
contractor:	Kansas City Bridge Company, Kansas City MO
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 076001.8; Ray County Court Record, Book 1: page 580 (16 May 1924) -located at the Ray County Court-house, Richmond MO.
sign. rating:	44
evaluation:	NRHP non-eligible (typical example of common structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

South Mud Creek Bridge

RAY006

GENERAL DATA

structure no.:	103000.8	city/town:	3.5 miles west of Tinney
county:	Ray	feature inters.:	South Mud Creek
		cadastral grid:	S1/12, T54N, R27W
		highway route:	County Road 103
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 3-panel, pin-connected Pratt bedstead		
substructure:	steel bedstead leg abutments with timber backwalls		
span number:	1	condition:	fair
span length:	40.0'	alterations:	unknown
total length:	41.0'	floor/decking :	timber deck
roadway width:	12.5'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	c1905
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor:	unknown
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 103000.8.
sign. rating:	21
evaluation:	NRHP non-eligible (typical example of common structural type, poorly documented)

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked Creek Bridge

RAY007

GENERAL DATA

structure no.:	156001.2	city/town:	2.0 miles south of Millville
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S27, T53N, R27W
		highway route:	County Road 156
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 5-panel, rigid-connected Pratt pony truss
substructure: concrete-filled, steel cylinder piers

span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	117.0'	floor/decking :	timber deck
roadway width:	14.0'	other features:	steel angle guardrails

HISTORICAL DATA

erection date: 1913
erection cost: unknown
designer: Kansas City Bridge Company, Kansas City MO (probable)
fabricator : Kansas City Bridge Company, Kansas City MO (probable)
contractor: county work force

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 156001.2; Ray County Court Record, Book W, page 362 (9 July 1913) - located at Ray County Courthouse, Richmond MO.

sign. rating: 40
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked River Bridge

RAY008

GENERAL DATA

structure no.:	167001.4	city/town:	7.7 miles northwest of Richmond
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S28, T53N, R28W
		highway route:	County Road 167
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 5-panel, rigid-connected Pratt through truss with steel stringer approaches on each end

substructure: concrete abutments and wingwalls; concrete-filled, steel cylinder piers

span number:	1	condition:	fair
span length:	100.0'	alterations:	none
total length:	160.0'	floor/decking :	timber deck over steel stringers
roadway width:	12.6'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 angles with batten plates; vertical: 4 angles with lacing; diagonal: 2 angles with lacing; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam; guard-rail: 2 channels; builder's plate: 1912 / Built by Kansas City Bridge Co / Kansas City MO / D.T. Maddux Pres Judge / C. McGuage Assoc Judge / J.M. Summers Assoc Judge / E.A. Ringo Co Clerk

HISTORICAL DATA

erection date: 1912

erection cost: unknown

designer: Kansas City Bridge Company, Kansas City MO

fabricator : Kansas City Bridge Company, Kansas City MO;
Lackawanna Steel Company, Pittsburgh PA

contractor: Kansas City Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 167001.4; Ray County Court Record, Book W: pages 78-80 (8 May 1912), page 108 (8 August 1912); Book Z: page 449 (13 March 1922) - located at the Ray County Courthouse, Richmond MO; field inspection by Lon Johnson, 8 September 1990.

sign. rating: 47

evaluation: NRHP possibly eligible (early example of mainstay structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Lick Creek Bridge

RAY010

GENERAL DATA

structure no.:	191003.3	city/town:	6.5 miles northwest of Orrick
county:	Ray	feature inters.:	Lick Creek
		cadastral grid:	S31, T52N, R29W
		highway route:	County Road 191
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 3-panel, pin-connected Pratt bedstead
substructure: concrete abutments and wingwalls

span number:	1	condition:	fair
span length:	56.0'	alterations:	none
total length:	58.0'	floor/decking :	concrete deck over steel stringers
roadway width:	10.9'	other features:	steel angle guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 191003.3.

sign. rating: 28
evaluation: NRHP non-eligible (typical example of common structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Fishing River Bridge

RAY011

GENERAL DATA

structure no.: 220000.2	city/town: 4.5 miles northwest of Richmond
county: Ray	feature inters.: Fishing River
	cadastral grid: S16, T52N, R28W
	highway route: County Road 220
	highway distr.: 4
	current owner: Ray County

STRUCTURAL DATA

superstructure: steel, 5-panel, rigid-connected Pratt pony truss	
substructure: concrete abutments and wingwalls	
span number: 1	condition: fair
span length: 80.0'	alterations: unknown
total length: 80.0'	floor/decking : timber deck over steel stringers
roadway width: 12.9'	other features: steel angle guardrails

HISTORICAL DATA

erection date: 1913	
erection cost: unknown	
designer: Kansas City Bridge Company, Kansas City MO (probable)	
fabricator : Kansas City Bridge Company, Kansas City MO (probable)	
contractor: county work force	
references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 220000.2; Ray County Court Record, Book W, page 362 (9 July 1913) - located at Ray County Courthouse, Richmond MO.	
sign. rating: 40	
evaluation: NRHP non-eligible (typical example of common structural type)	

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked River Bridge

RAY012

GENERAL DATA

structure no.:	239000.4	city/town:	1.5 miles northeast of Richmond
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S29, T52N, R27W
		highway route:	County Road 239
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 5-panel, rigid connected, two-angle Camelback pony truss		
substructure:	concrete abutments, timber wingwalls and steel pile bent piers		
span number:	1	condition:	fair
span length:	78.0'	alterations:	steel plates welded along top chord, lower chord, verticals and diagonals
total length:	78.0'	floor/decking :	timber deck over steel stringers
roadway width:	13.7'	other features:	upper chord and inclined end post, lower chord, vertical, diagonal: 2 angles; lateral bracing: round rod with threaded ends; floor beam: I-beam; guardrail: steel angle

HISTORICAL DATA

erection date:	c1925
erection cost:	unknown
designer:	unknown
fabricator :	unknown
contractor:	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 239000.4; field inspection by Lon Johnson, 11 September 1990.

sign. rating:	43
evaluation:	NRHP non-eligible (poorly documented example of uncommon structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked River Bridge

RAY013

GENERAL DATA

structure no.:	244003.4	city/town:	1.5 miles east of Richmond
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S22/27, T52N, R27W
		highway route:	County Road 244
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 5-panel, rigid-connected Pratt pony truss		
substructure:	concrete abutments and wingwalls, steel cylinder piers		
span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	119.0'	floor/decking :	timber deck over steel stringers
roadway width:	12.8'	other features:	steel angle guardrails

HISTORICAL DATA

erection date:	1913
erection cost:	unknown
designer:	Kansas City Bridge Company, Kansas City MO (probable)

		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 5-panel, pin-connected Pratt pony truss
substructure: concrete abutments and wingwalls; concrete-filled steel cylinder piers

span number:	1	condition:	fair
span length:	80.0'	alterations:	unknown
total length:	130.0'	floor/decking :	timber deck
roadway width:	11.8'	other features:	steel angle guardrails

HISTORICAL DATA

erection date: c1910
erection cost: unknown
designer: unknown
fabricator : unknown
contractor: unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 249002.6.

sign. rating: 30
evaluation: NRHP non-eligible (typical example of common structural type, poorly documented)

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked River Bridge

RAY015

GENERAL DATA

structure no.:	257001.6	city/town:	8.5 miles east of Richmond
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S24/25, T52N, R27W
		highway route:	County Road 257
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: wrought iron or steel, 6-panel, pin-connected Pratt through truss; 2 steel stringer approaches on north end; 1 steel stringer approach on south end

substructure: timber pile bent abutments; concrete-filled iron cylinder piers; stone pier

span number:	1	condition:	fair
span length:	102.0'	alterations:	approach spans altered
total length:	162.0'	floor/decking :	timber deck over steel stringers
roadway width:	10.8'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 looped square or rectangular eyebars; vertical: 2 channels with lacing (looped square eyebar at hip); diagonal: 2 looped rectangular eyebars; counter: round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 4 angles with lacing; floor beam: riveted plate girder, U-bolted to lower chord pins; guardrail: steel pipe; lattice portal strut; portal builder's plate: Wrought Iron Bridge Co / Builders / Canton Ohio

HISTORICAL DATA

erection date: 1889
erection cost: \$795.00 (contract amount)
designer: Wrought Iron Bridge Company, Canton OH
fabricator : Wrought Iron Bridge Company, Canton OH
contractor: Wrought Iron Bridge Company, Canton OH

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 257001.6; Ray County Court Record, Book M: page 418 (7 January and 7 May 1889) - located at the Ray County Courthouse, Richmond MO; field inspection by Lon Johnson, 11 September 1990.

sign. rating: 51
evaluation: NRHP possibly eligible (well-preserved, early example of mainstay structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Crooked River Bridge

RAY016

GENERAL DATA

structure no.:	289001.3	city/town:	6.8 miles southeast of Richmond
county:	Ray	feature inters.:	Crooked River
		cadastral grid:	S6, T51N, R26W
		highway route:	County Road 289
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 7-panel, pin-connected Pratt through truss; steel stringer approaches at either end

substructure: steel pile bent abutments; concrete-filled steel cylinder piers

span number:	1	condition:	fair
span length:	120.0'	alterations:	none
total length:	159.0'	floor/decking :	timber deck over steel stringers
roadway width:	11.0'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 looped rectangular eyebars; vertical: 2 channels with lacing (2 angles with batten plates at hip); diagonal: 2 looped rectangular eyebars; counter: square eyebar with turnbuckle; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam, field-bolted to vertical; guardrail: steel pipe; bridge plate: 1908 / J.G. Van Trump Pres Judge / Job Slack Assoc. Judge / E.A. Ringo County Clerk / W.A. Mullin Co. R&B Commissioner

HISTORICAL DATA

erection date: 1908

erection cost: \$2820.00 (three-bridge contract)

designer: Kansas City Bridge Company, Kansas City MO

fabricator : Kansas City Bridge Company, Kansas City MO

contractor: Kansas City Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 289001.3; Ray County Court Record, Book T: page 565 (7 May 1908), pages 612-14 (8 September 1908) - located at the Ray County Courthouse, Richmond MO; field inspection by Lon Johnson, 11 September 1990.

sign. rating: 48

evaluation: NRHP non-eligible (typical example of mainstay structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Rolling Creek Bridge

RAY017

GENERAL DATA

structure no.:	351002.4	city/town:	2.0 miles northeast of Orrick
county:	Ray	feature inters.:	Rolling Creek
		cadastral grid:	S13, T51N, R29W
		highway route:	County Road 351
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	concrete filled spandrel arch		
substructure:	concrete abutments and wingwalls		
span number:	1	condition:	poor
span length:	30.0'	alterations:	concrete has failed in several places
total length:	30.0'	floor/decking :	gravel over concrete
roadway width:	14.5'	other features:	concrete guardrails

HISTORICAL DATA

erection date:	c1920
erection cost:	unknown
designer:	unknown
fabricator :	none
contractor:	unknown

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 351002.4; field inspection by Lon Johnson, 9 September 1990.

sign. rating:	20
evaluation:	NRHP non-eligible (poorly preserved example of concrete arch construction)

Inventoried by: Michelle Crow-Dolby 3 August 1992

Hall Stone Bridge

RAY018

GENERAL DATA

structure no.:	369002.6	city/town:	4.0 miles northwest of Orrick
county:	Ray	feature inters.:	Fishing River
		cadastral grid:	S4, T51N, R29W
		highway route:	County Road 369
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure: steel, 6-panel, pin-connected Pratt through truss; steel stinger approach spans

substructure: concrete abutments; stone piers with concrete caps

span number:	1	condition:	fair
span length:	106.0'	alterations:	original concrete deck removed
total length:	144.0'	floor/decking :	timber deck over steel stringers
roadway width:	13.8'	other features:	upper chord: 2 channels with cover plate and batten plates; lower chord: 2 punched rectangular eyebars; vertical: 2 channels with lacing (2 angles with batten plates at hip); diagonal: 2 angles with batten plates; counter: round eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 2 angles; floor beam: I-beam; guardrail: steel pipe; bridge plate: J.G. Van Trump Pres Judge / Assoc Judges / R.A. King Job Slack / E.A. Ringo Co Clerk / J.M. Rhodes / Co Highway Engr / 1908

HISTORICAL DATA

erection date: 1908
erection cost: \$2830.00 (three-bridge contract)
designer: Kansas City Bridge Company, Kansas City MO
fabricator : Kansas City Bridge Company, Kansas City MO
contractor: Kansas City Bridge Company, Kansas City MO

references: Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 369002.6; Ray County Court Record, Book T: pages 612-14 (8 September 1908) - located at the Ray County Courthouse, Richmond MO; field inspection by Lon Johnson, 9 September 1990.

sign. rating: 48
evaluation: NRHP non-eligible (typical example of mainstay structural type)

inventoried by: Michelle Crow-Dolby 3 August 1992

Oinck Bridge

RAY019

GENERAL DATA

structure no.:	376000.8	city/town:	1.5 miles south of Orrick
county:	Ray	feature inters.:	Fishing River
		cadastral grid:	S27, T51N, R29W
		highway route:	County Road 376
		highway distr.:	4
		current owner:	Ray County

STRUCTURAL DATA

superstructure:	steel, 8-panel, pin-connected Pratt through truss; 2 steel stringer approaches at each end		
substructure:	steel pile bent abutments; concrete-filled steel cylinder piers		
span number:	1	condition:	good
span length:	160.0'	alterations:	none
total length:	232.0'	floor/decking :	timber deck over steel stringers
roadway width:	11.8'	other features:	upper chord and inclined end post: 2 channels with cover plate and lacing; lower chord: 2 punched rectangular eye-bars; vertical: 2 channels with lacing (4 angles with lacing at hip); diagonal: 2 punched rectangular eye-bars; counter: eyerod with turnbuckle; lateral bracing: round rod with threaded ends; strut: 2 angles with knee braces; floor beam: I-beam; guardrail: 2 channels

HISTORICAL DATA

erection date:	1904
erection cost:	\$5900.00 (contract amount)
designer:	American Bridge Company, New York NY
fabricator :	American Bridge Company, New York NY
contractor:	American Bridge Company, New York NY
references:	Missouri Highway and Transportation Department, Structure Inventory and Appraisal: Structure Number 376000.8; Ray County Court Record, Book R: page 569 (2 August 1904) -located at the Ray County Courthouse, Richmond MO; field inspection by Lon Johnson, 9 September 1990.
sign. rating:	51
evaluation:	NRHP possibly eligible (well-preserved, long-span example of mainstay structural type)

Waddell, Consulting Engineer, New York, NY and Kansas City, MO; Supervised by Missouri State Highway Commission; B.H. Piepmeier, Chief Engineer; Contractor - Kansas City Bridge Co., Kansas City, MO

The wide and unpredictable Missouri River, which forms the border between Ray and Lafayette Counties, has always severely hampered transportation efforts in the area. Gilead Rupe pioneered the first effort to cross the river in the early 1800s when he operated a ferry across the expanse of water. For the next several decades, various ferry businesses carried people, livestock, and wagons across the Missouri, although they were both expensive and time consuming. Finally, on 30 September 1889, citizens celebrated the opening of a new pontoon toll bridge, which charged only fifty cents per crossing. The new span, however, proved inadequate for the heavy loads and inclement weather and was soon abandoned. Obtaining sufficient funds to construct a new bridge was the biggest deterrent facing

local citizens, and consequently, the river remained unspanned for many years. It was not until 1922 that the Lexington Chamber of Commerce appointed a bridge committee to secure securing monies for a permanent structure spanning the Missouri River at Lexington. Through federal grants, bonds, and personal subscriptions, the industrious committee procured enough money to finance the proposed bridge building project. The United States Government paid for one-half the cost of the bridge, and Lafayette and Ray Counties jointly funded the other half, in proportion to their assessed valuation. Ray's allotment was not to exceed \$192,000.00 and Lafayette's share was not to surpass \$258,000.00. Total estimated cost for the new crossing was nearly \$900,000.00. Once Ray County voters approved a \$192,000.00 bond issue in September of 1922 for the county's appointed cost for the Lexington Bridge, the county advertised for competitive construction bids, due in December of 1922.

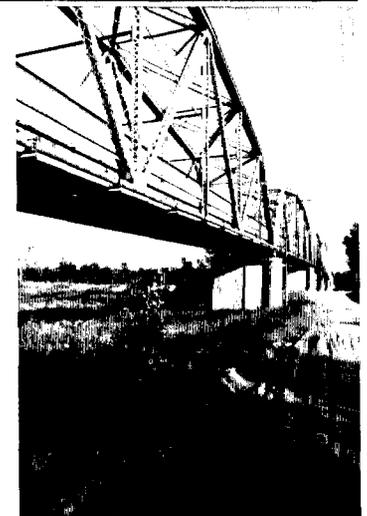

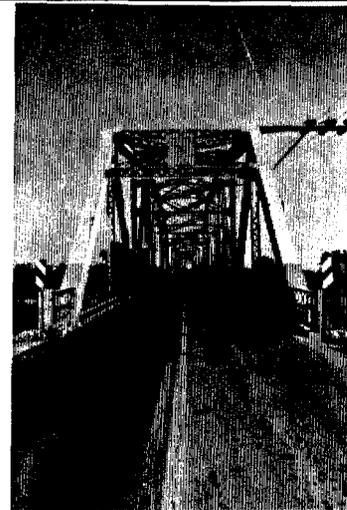

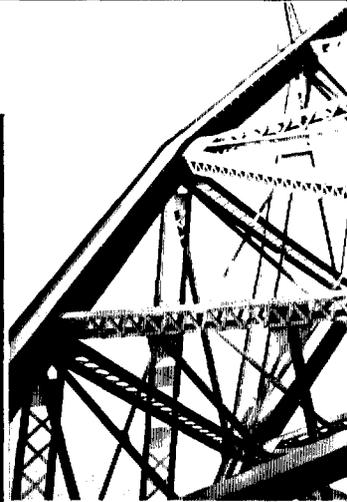

Awarded the \$1,086,294.15 contract, Missouri-based Kansas City Bridge Company began making preparations for the erection of the 3073-foot steel structure, designed by the renowned J.A.L. Waddell based out of New York City and Kansas City. Kansas City utilized steel components rolled by Union Bridge and Construction Company to construct the imposing ten span crossing. Comprised of seven Warren through trusses, three four-panel Warren deck trusses, and eight steel girder approaches, the bridge features riveted connections throughout. The entire structure rests on a concrete substructure. Kansas City completed the Lexington Bridge in time for a 5 November 1925 dedication ceremony that attracted thousands of local citizens and numerous dignitaries. Requiring only maintenance-related repairs since its construction, the Lexington Bridge continues to carry regional vehicular traffic as a major state highway link between Ray and Lexington Counties.

Throughout the 1920s and 1930s the Missouri State Highway Department relied almost exclusively on rigid-connected Pratt and Parker configurations for its medium-span through trusses. The agency adopted Warren configurations for its pony trusses and for its through trusses over the Missouri and Mississippi rivers. Thus, the Lexington Bridge, a long-span major river crossing, is a well-preserved example of this state highway department bridge construction trend.

Located northwest of Elmira, this medium-span steel truss carries a gravel-surfaced county road over Brushy Creek. The Brushy Creek Bridge is comprised of a single rigid-connected Warren pony truss, with a timber deck and steel cylinder piers. The bridge dates to 1904. That year the Ray County Court contracted with the Kansas City Bridge Company to supply and erect the structure. Since its completion, the Brushy Creek Bridge has carried vehicular traffic, with only maintenance-related repairs.

Patented in 1848 by Captain James Warren and Theobald Monzani, the Warren truss in its classic form features a web configuration that relies on simple triangulation for its rigidity. "The term Warren truss or Warren girder was originally applied only to the particular case of the Triangular truss in which the web triangles are all equilateral; but later writers generally use the name for any triangular truss," noted bridge engineer J.A.L. Waddell stated in his 1916 **Bridge Engineering**. "As there is no special advantage in making the web triangles equilateral, there does not appear to be any good *raison d'être* for the use of the true Warren type." Warrens were built sparingly in the 19th century, a period in which the pin-connected Pratt dominated the bridge industry. After the turn of the century, however, rigid-connected Warren trusses began to supersede earlier pinned Pratt configurations for use on short- to intermediate-span highway bridges. The Brushy Creek Bridge in Ray County is significant as the earliest documented example in Missouri of the riveted Warren truss—a medium-span example of what would later become a mainstay structural type in the state.

This short-span through truss carries an unpaved county road across the Crooked River northwest of Richmond. The bridge consists of a single rigid-connected Pratt truss, supported by steel cylinder piers, with steel stringer approach spans over concrete abutments on each end. Ray County records make only terse references to bridge construction, but they—and a builder's plate on the bridge itself—indicate that this bridge was constructed here in 1912 by the Kansas City Bridge Company. Since its completion, the Crooked River Bridge has carried intermittent traffic at this rural crossing, in unaltered condition.

The Missouri State Highway Department employed the riveted Pratt configuration as its standard medium-span truss design for hundreds of bridges throughout the state. This bridge type was thus a mainstay structural type in Missouri during the 1920s and 1930s. But before the highway department developed its design, the counties had begun building riveted Pratts on their own, based on standard designs by the regional bridge builders. Relatively few pre-MSHD riveted Pratts were built in Missouri by the counties, owing to the short time span between their introduction and their adoption by the highway department. The Crooked River Bridge in Ray County is noteworthy among these as one of the oldest surviving riveted Pratt through truss in Missouri—a well-preserved, early example of a state bridge staple.

Spanning the Crooked River east of Richmond in southeastern Ray County, this 102-foot Pratt through truss dates to 1889. In May of that year, the Ray County Court awarded the Wrought Iron Bridge Company a contract to remove an old bridge at this location and erect a new truss. Courthouse records list the contract amount as \$795.00, with the Canton, Ohio-based contractor providing a \$1590.00 bond to secure its work. Additionally, Wrought Iron was required to raise the previous bridge's stone piers and abutments by three feet to provide the new truss with a higher water clearance. Completed the same year, the structure continues to carry intermittent traffic in its original location while retaining a high degree of both structural and historical integrity.

In Missouri the pinned Pratt through truss was the bridge of choice for short- and medium-span applications in the late 19th and early 20th centuries. Most of the structures erected during this period were based on standard plans developed either by the state highway department (after 1917) or by the individual bridge companies, such as the prolific Wrought Iron Bridge Company in Canton, Ohio. As a result, thousands of Pratts were built across the state, all very much alike in detailing, and today the Pratt truss constitutes the most populous group of through trusses. The Crooked River Bridge is thus distinguished as an early example of this bridge construction trend.

This Pratt through truss carries an unpaved county road over the Crooked River some seven miles southeast of Richmond in the southeastern corner of Ray County. Approached at either end by steel stringers and featuring pinned connections throughout, the timber-decked structure spans 120 feet. The bridge traces its construction history to May of 1908, when, according to county court records, the county highway engineer was asked to make plans, advertise, and take bids for a bridge at this location. Several months later a contract for three bridges, including this truss, was let to the Kansas City Bridge Company for the aggregate sum of \$2820.00. According to its bridge plate, the crossing was completed in 1908 by KCBCo. Since its construction, the Crooked River Bridge has serviced county-road traffic in essentially unaltered condition, with its overall integrity intact.

In Missouri, the pinned Pratt through truss was the bridge of choice for short- and medium-span applications in the late 19th and early 20th centuries. As a result, thousands of Pratts were built across the state, and today Pratts constitute the most populous group of through trusses. Though it retains a relatively high degree of physical integrity, the Crooked River Bridge is unremarkable in its design, dimensions, and detailing.

The Hall Stone Bridge spans Fishing River four miles northwest of Orrick in southwestern Ray County. Approached at either end by steel stringers and supported by stone piers and concrete abutments, this Pratt through truss dates to 1908. The structure's builder's plate indicates a 1908 construction date. The bridge was erected here by the Kansas City Bridge Company, which constructed the majority of Ray County's bridges during this period. Additionally, court records reveal a three-bridge contract with the Missouri bridge contractor, totaling \$2830.00, which probably included this span. Since its construction, the truss has functioned in place in its rural setting.

In Missouri, the pinned Pratt through truss was the bridge of choice for short- and medium-span applications in the late 19th and early 20th centuries. As a result, thousands of Pratts were built across the state, and today Pratts constitute the most populous group of through trusses. Carrying a county road in the southwestern corner of Ray County, the Oinck Bridge spans the Fishing River south of Orrick. The Pratt through truss features pinned connections throughout and has an overall length of 232 feet. The entire structure is supported by a steel substructure. On August 2, 1904, a contract was let to American Bridge Company to fabricate and build this bridge and two others. The contract amount for this structure, \$5900.00, was unusually high, apparently owing to the bridge's large scale. The New York-based contractor presumably completed the crossing the same year with no notable difficulties. Since its construction, the Oinck Bridge has retained a high degree of structural integrity and continues to carry vehicular traffic in its rural setting.

Marketed exclusively by virtually all of the in-state and regional bridge contractors and promoted in the form of standardized designs, the pinned Pratt through truss was widely used by Missouri's counties to carry roads over the state's myriad watercourses. Thousands of such trusses were erected across the state in the late 19th and early 20th centuries, and many remain in place today. The Oinck Bridge, with unremarkable dimensions and detailing, thus typifies this widespread bridge building trend.
